Merely having a scanner covering cordless frequencies is *not* an offense under the existing law or the law as it would be modified by the act. What the law does proscribe is the INTENTIONAL act of intercepting or attempting to intercept certain described communications. The section of the law affected does not deem scanners contraband or illegal to possess. The prosecution would have to prove beyond a reasonable doubt that the accused INTENTIONALLY intercepted or attempted to intercept or procured another person to do or attempt to do the act. Proof of attempt requires more than merely having the means to effect the act at one's disposal, especially where possession of a scanner that happens to be capable of receiving cordless phone frequencies is legal per se.

All this Act does with respect to reception of radio signals is remove the first offense lesser penalty provision. No hobbyist is affected what-so-ever unless that hobbyist intentionally engages in what already has been deemed criminal behavior for a number of years, and the only affect is that the penalty is now potentially more severe.

73,

---Ken   W2KB@ARRL.net   VC-NJ   KofC DGK 10627

I don't know about the others, but the 40 MHZ frequencies
are shared with the DOD on a non-interference basis. It is
not again the law to listen to these frequncies (some are MARS
frequncies). What gets me, is that I'm on the fringe of Bragg's
46.75 Air Ground Range control frequency and use 36F3 modulation.
I hear almost as much telephone conversations on my R-442/VRC
as I do the Army.   Same-same for ArNG Apache Bn and the
Warthogs that were at Bragg on their air-air frequencies.   I wish
DOD would void the agreement with the FCC for use of those
frequncies!

>> So merely being stopped by a cop with the cordless phone frequencies in
your scanner could conceivably result in life long loss of important rights
and privileges. <<

Well, no, that's not the case.

Merely having a scanner covering cordless frequencies is *not* an offense
under the existing law or the law as it would be modified by the act.
What the law does proscribe is the INTENTIONAL act of intercepting or
attempting to intercept certain described communications. The section of
the law affected does not deem scanners contraband or illegal to possess.
The prosecution would have to prove beyond a reasonable doubt that the
accused INTENTIONALLY intercepted or attempted to intercept or procured
another person to do or attempt to do the act. Proof of attempt requires
more than merely having the means to effect the act at one's disposal,
especially where possession of a scanner that happens to be capable of
receiving cordless phone frequencies is legal per se.

All this Act does with respect to reception of radio signals is remove the
first offense lesser penalty provision. No hobbyist is affected
what-so-ever unless that hobbyist intentionally engages in what already has
been deemed criminal behavior for a number of years, and the only affect is
that the penalty is now potentially more severe.

How would this bill stop the activities of terrorists? They don't care
about the law, and they have enough funds to either procure or have
modified equipment.

We are losing all sorts of freedoms these days, so it doesn't suprise
me
that they will slowly start to come after our hobby.

The only logical motivation to enact this
legislation, that I can think of, is to keep the terrorists from
listening
in on our law enforcement and emergency reaction infrastructure.

Based on current and furture laws like this,
one can only come to the conclusion that the government believes the
general public can't be trusted and must be restricted in any way
necessary
to support public safety. Just one more thing to add to the list...

How the heck did 'terrorist' get into this? It's not about terrorist,
it's
about privacy.

The law was enacted almost specifically to be able to nail people to the
wall (after the fact) that intercept phone calls on scanners and then
divulge the contents to the news or other outlets.

It has NOTHING TO DO WITH TERRORIST!! How the heck did
the topic get mutated to that?

That is cause the industry has brainwashed the govt and commercial
companinies that anything over three to five years is "unsupportable"!
Around here anything over three is replaced rather than repaired, and
working systems are replaced in five.  This floods the secondhand market
with near new machines,  When I retire next month, the Twinspin with 3G
hd, cdrom, PCMCIA, usb, color, etc., etc. will be surplussed.

   >can be added to ANY PC to give it a voice...

   I don't know about your kneck of the woods, but around here, a 386 or
   486
   PC is becoming a rarity.

   Two years ago I showed up at a hamfest with almost two dozen
   cleaned-up &
   working 386 and 486 machines, all with NIC's, hard drives, and VGA
   cards,
   and we managed to GIVE two of them away.   Yes, we could not even
   GIVE them
   away.   The Boy Scouts wouldn't even take them for their semi-annual
   computer swap meet.   A local business that specializes in
   refurbished
   computers came over and took less than an armful of parts (mostly
   memory
   and a 2X CD ROM Drive).   The rest went to the county landfill.

   It seems to me that Hams are the biggest computer snobs around, if it
   ain't
   got a P4 or an Athlon processor with a Gig of DDR RAM, well...they're
   not
   interested, at any price.

   73,

   Mark

It's about legislating the non-nude status of the emperor.

The problem is the false expectation of privacy, where there is none.

This is probably a VERY accurate statement, as that is EXACTLY the
reason the original cellular privacy statutes got passed in the first
place.
All this NEW law does is give them more teeth.

If you want privacy, do not use a radio. If you transmit a rdaio signal,
someone will hear it. It is as simple as that. You cannot "fix" a
technology problem with laws. It is like passing a law that you car tire
cannot go flat. The comm act of 1934 worked fine before it was ammended.

And all because they refuse to admit that they have no expectation of privacy.

When they first started, privacy was a concern, and the gp were told that
they were not able to be picked up on scanners, which conveyed a
deliberately false expectation of privacy. As in the story of the emperor's
new clothes, the general public was encouraged to believe that everything
was just fine.

Of course the scanner makers jumped right in and built the scanners,
because of public demand. (important point!)

After a number of incidents where politicians were monitored with
embarrassing results, this ECPA was passed, which essentially makes it a
crime to look at the nude emperor, thereby "preserving" his privacy.

Rendered body type: text/plain

That's funny, not 2 minutes ago I was looking at my last posit on Findu and
I came up with the same anomaly;

Raw packet:

```
N1BQ-8>TTSQ7S,N1BQ-3,WA2UMX-2*,WIDE2-2,qAR,N2LBT-1*:'dORl#Xk/]"96}
```

I was rather puzzled too, though not so much by the "qAR", but that there
was a callsign following ... now WA2UMX-2 feeds to the Albany aprsd digi so
this is possible ... N2LBT-1 is a station in the area of Albany ...

-----Original Message-----
From: bounce-aprssig-25883@lists.tapr.org
[mailto:bounce-aprssig-25883@lists.tapr.org]On Behalf Of bob evinger
Sent: Thursday, July 18, 2002 12:02 AM
To: TAPR APRS Special Interest Group
Subject: [aprssig] aprsd inserting qAR in the path, anyone know what it
is?

I had someone ask me what the 'qAR' was in the path when I am gating ISS
packets. I thought maybe it was everyone but it looks like only packets
that I gate are listing them. An example from ariss.net follows

```
00:14:54:42 : KF4UUL]CQ,RS0ISS*,qAR,WD9EKA-15*:Wayne Spartanburg SC
```

I dont believe I am doing anything specific to insert it. My guess is it
a result of my 2 aprsd processes passing things along but the truth is I
just dont know.

Any other aprsd admins out there know where it is coming from?

bob

603. [aprssig] PCsat ops normal on Weekend

From: Bob Bruninga <bruninga@usna.edu>

Rendered body type: text/plain

PCsat will be "OPS NORMAL" on the weekend. The last few days and Firday we have been trying a new power saver mode to see if we can make it through eclipse but no joy. We had been turning DIGI off. (sorry)...

But for the weekend we will leave digi on and let users have it again and probably into next week too.. In this mode the only alias that works is via W3ADO-1. (Except for priority users on the side B uplink. see below).

PCsat is in max eclipse cycles now (35%) but by 25 July it will improve to only 30% and so we will try our low power modes again then.. In the mean time, enjoy...

We only have one priority user right now (if anyone else is on special travel, let us konw?). Look for N3IYI's railroad car downlinking on 144.39 over the east coast.

And during the 3 weeks begining 29 July we should have several people on Naval Academy boats attempting to be tracked a few times a day via PCsat, ISS and UO-22 out in the Atlantic.

604. [aprssig] Backboned APRS?

From: Jeff Reinhardt <jreinh@ix.netcom.com>
Date: Thu, 18 Jul 2002 16:34:46 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-90080-2002.07.18-19.13.52--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Much has been written about the congestion on 144.39 in Southern California (SoCal). If anything, APRS use seems to be holding steady or growing. A two-hour stint connected to the web last weekend showed nearly 4,000 stations on the air (thankfully, not all in CA!)

Several weeks ago, I think Bob posted a note about the possibilities of carrying some of the APRS load on a 440 MHz backbone. Unfortunately, I did not retain that message, but it spurred my thinking in this matter.

The APA Digital Communications Network (APA) is a club that operates a backboned system covering a good portion (but not all of SoCal. APA also operates two APRS digis in the region, one near Gorman in the north, the other on Castro Peak near Malibu, which is where the "hub" of the backboned system is located. The backboned system was designed to support keyboard and BBS operations, which lately, has not seen much use.

While I cannot speak for the entire APA Board, which would have to approve such an experiment, I believe the group may be willing to engage in a trial that investigates the viability of a backboned APRS system.

The backboned network presently has 2 meter ports operating at 1200 bps in several (low altitude) locations with the mountain top backboned repeater providing connectivity between nodes. The backbone operates at 9600 bps through a coordinated full duplex repeater using Motorola (Mitrek) radios at the repeater site and at low level stations.

If there is interest in using this resource as a means to decrease APRS 2 meter traffic in SoCal, we would need to know who is interested and how the network could be used to enhance throughput, a concept that I believe would be the first of its type. How it would operate and achieve its goals is undetermined. The possibility of moving APA equipment around, if needed, could be explored.

The 9600 backbone might also be used to move data to/from the internet if that is a desired function that has utility. It is probably not practical, at least at the outset, to consider having the 9600 backbone accessible to home stations, or for that fact, mobile units.

Considering the use of this resource, I have many questions:
Ideally, could such a system allow SoCal to return to normal path statements that allow mobiles a "seamless" transition into the area? What traffic would be placed onto the backbone? How could the backbone be effectively used by digis to reduce 2m loading?

At present we are using Kantronics KPC-9612 units (with K-Net node chips) at the user ports of the network. Could these be used for APRS+backbone use? How would traffic be parsed into/out of the network? Would a computer driven KISS operation be a better way to operate?

A few days ago, I posted a similar message on the California APRS SIG and have received only one response expressing possible interest in the project. I place the concept here with the thoughts that perhaps not all SoCal SYSOPS get the CA SIG and also challenging Bob and others to conceptualize whether or not a networked regional system has value.

To summarize, APA has the hardware; the question is whether or not it has value to the advancement of APRS in SoCal and possibly elsewhere. Constructive thoughts on the matter are most welcome.

Jeff Reinhardt AA6JR
Member of the Board - APA Digital Communications Network

Great! Someone will finally try to use UO-22 for APRS. Or have there been people using it already for the past week or so? If so, I haven't seen them (only occaisional PBBS), and the Satgate has been on almost

continuously for over a week now. I hope the Academy boats don't go too
far out and leave me out of their footprint!

I use them for SSTV and APRS.
They work about as well as a 1/4 wave whip.
Do watch the tuning, it drifts. Retune about every 6 mos.

I've got one. 2m performance is poor. Match is good...radiation is not
;-)

On 440 performance is much better.

If you live in an area with good digi & relay coverage the antenna will
work fine for a tracker.

You might check out Larsen's glass mount antennas, if you haven't already.
They're a bit higher priced, but you will get higher performance.

```
Yes, I see what you mean.  I did not encounter the problem until you pointed
this out.  The reason I did not encounter the problem was that I have a HOME
screen file and as soon as I opened the full screen file with the Icons at
the wrong locations, I pressed the House button or H key and it brings up my
home file with the Icons at the correct locations!

Hopefully the Sproul's will issue and upgrade to correct this problem but
until then, I can live with it.  Thanks Joe for the info.  I love it!

> You might check out Larsen's glass mount antennas

I have Larsen's glass mount dual bander. Obviously it isn't as good as an antenna popped through a hole in the roof but I find it works well -- certainly better than I had been lead to believe it would work. It does not need any tuning and has good SWR. It is currently used with my D700. Before that I had it on my D7.

> They're a bit higher priced,

Bit? That's an understatement. Try twice as much.

> but you will get higher performance.

I can't speak to long-term performance. My father has a Radio Shack dual-band glass mount on his car. Out of the box, it seemed to work just about as well as my Larsen (in terms of SWR and reach). The Larsen did feel a lot better built, however.
A company I worked for used Larsen glass mount 800mHz antennas for years (anyone want to buy some used Motorola STX radios/amps/converta-coms cheap?). We never had any problems with them falling off in the hot and salty Florida weather nor did they go out of tune. Two thumbs up to Larsen!
(The higher the frequency, the better the antenna works on glass, of course.)

Unless you are looking to do some weak signal work, the glass mount antenna (either of them) will probably work just fine. If you want the antenna to last a long time and work well, spend the extra bucks and get the better made Larsen antenna.

My RS glassmounts spent 80kmiles on one car, and are on their second car.

I figure if the antenna outlasts the car, it's good enough.

I got some clear doublestick tape from there, two strips is about perfect.
Works great.

If the glass were infinitely thin, that would be true.
However, the additional separation isn't that significant, and has proven
to be insignificant in operation as well.

The current beta version of aprsd 2.1.5b6 server added this feature,
"The server now adds information to the end of the PATH indicating the
    source of each packet . This is the qAc,CallSign construct."
Similar to UI-Views IGATE function but much more informative.

Rendered body type: text/plain

I've remounted dozens of them (in cellular service) and all that is
necessary is a tube of rear-view mirror glue (available at most auto-supply
stores) for the metalic foot, and a little clear RTV Silicone rubber (also
available at auto or home hardware stores) for the plastic part.
Scrupulously clean the glass with isopropyl alcohol and let dry.
Remount the base sans antenna, and let cure for 24 hours or overnight at
minimum, (a piece of duct tape might be necessary if the vehicle is to be
driven immediately) then adjust and re-install the antenna, you should be
fine. A little lacquer thinner on a rag will then remove the duct tape
splooge after removal.

As far as performance goes, on-glass antennas suffer from low bandwidth,
the lower the freq the worse, and a susceptability to metalics used in some
windshields for UV protection (Notably Ford, Mercedez, and a couple Jap
cars like the lexus).

On glass antenna should always be considered a last choice for an antenna.
Never a first choice...

Yes, I just started to transition over to it (again). Done one schematic so
far and I like it. Once you get used to the europeon way of thinking it is
not too bad. Not yet done a PCB on it but I don't have a deadline looming
over me this time so I can spend the time to learn it.

>I'm trying to create a library for a

Can't help you here other then to direct you to their newsgroup which does
seem fairly helpful. You can get info on this off their website. This is my
second attempt at EagleCad (the first was a few years ago) and I recall the
reason I aborted it the first time was I didn't have time to figure out the
libraries and ended up going back to my old DOS Orcad to do the PCB.

I've noted the doublesided tape from Radio Schlack is thicker than the
Antenna specialist tape. This affects tuning and performance. You're better
to go thinner than thicker, as you're severely lowering the capacitance.
The mount box/glass/mount foot should be viewed as a series capacitor with
the antenna.
```

Rendered body type: text/plain

Trying to connect a sound card TNC (AGWPE) to a Yaesu FT-2600M but can't get the audio to transmit.

Using RigBlaster and it works great with a Yaesu FT-847 but when I rejumper the RB for the 2600 mike connections, the transmit and receive work but no output audio. Tried both the mike input as well as the data port. Same results.

When using the mike connection (RJ12-6pin), when PTT is on, PACKET shows on the display. I have MIKE ON in the menu so audio SHOULD go through.

Anyone using a RigBlaster/2600M combination that can help?

625. [aprssig] Overlays for WinAPRS 2.6.1

From: "Joseph Brassard" <brassardjn@att.net>
Date: Fri, 19 Jul 2002 13:34:43
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-90198-2002.07.19-14.13.13--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For the Sproul Brothers:

Using an external text editor, and the identical format used for the DIGI overlays, I created a '.POS' file for an 'Overlay' to be superimposed on the WinAPRS map showing all of the mile markers, watering stations, aid stations and medical tent waypoints for the annual Air Force Marathon.

As an example, I edited waypoints into the database as:

```
Mile 1!3946.33N/08405.36W
Mile 2!3947.05N/08405.02W
Mile 3!3947.42N/08405.03W
etc..
```

When I bring up the "Display Overlay List" in WinAPRS2.6.1, the program has dropped the last 2 digits of the latitude/longitude readings and replaced them with "00" such as:

```
Mile 1  39 46'00"N   084 05' 00"W
Mile 2  39 47'00"N   084 05' 00"W
Mile 3  39 47'00"N   084 05' 00"W
etc..
```

This causes ALL waypoints to be erroneously located to the east and south of the intended location, and for some mile waypoints to occupy the same position.

Is there any way to modify the program to retain all the 6 and preferably 7/8 digits for a more precise visual display of the desired location such as:
39 46'32.9"N   084 05'36.1"W

Hello Joseph,

Your file is NOT identical to a POS file - it is missing symbols on the positions.

In past versions of WinAPRS, the decoding of the POS file format has been limited - only certain symbols work, and use of other symbols would cause positions to NOT be displayed... hence the existance of the LOG file version of the digipeater list.

I have no experience with v2.6.1, but I would guess it has the same limitations that previous ones have had. Try adding a symbol to the position, and restarting WinAPRS to load it.

They are missing the SYMBOL (icon) character so the format is not IAW the spec with possible undefined results... That might be the problem...

Message-ID: <LYR842-90209-2002.07.19-15.18.41--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Interesting comments on the benefits of APRS backhaul AND faster mobile transmission speeds.

This issue has been around for a while in Europe. Naturally the telephone tariff rates there drive the need, since there are no free local calls, hams have made use of AX.25 for their BBS and Igate like needs for both access and backhaul.

But when the Europeans talk of backhaul between digi's, they are doing it at much higher speeds than 9600 baud! More like 1.2 Mbps BPSK! See http://www.hamradio.si/hid.html; http://www.hamradio.si/1mbs.html ; http://www.hamradio.si/svv-hw.html ; http://lea.hamradio.si/~s53rm/SVE.htm or http://lea.hamradio.si/~s53rm/ for some serious hardware projects. Their projects and code are open, but would require some programming changes to be friendly to English.

It would seem appropriate that any backhaul between digi's today could use ISM band equipment (older AT&T WaveLan, or newer 802.11 cards) where connections to internet aren't available. So one way or another, you would think that high capacity backhaul solutions are possible and not very expensive.

Now if we could get APRS up to a higher speed life would be good. Even in sparsley populated areas of my province, I've heard 144.390 get very busy at times... enough so that a cheap telemetry application without a receiver (like MIM) would prove unreliable due to collisions.

Subject: [aprssig] PCsat ops normal on Weekend

PCsat will be "OPS NORMAL" on the weekend.  The last few days and Firday
we have been trying a new power saver mode to see if we can make it
through eclipse but no joy.  We had been turning DIGI off. (sorry)...

But for the weekend we will leave digi on and let users have it again and
probably into next week too..  In this mode the only alias that works is
via W3ADO-1. (Except for priority users on the side B uplink. see below).

PCsat is in max eclipse cycles now (35%) but by 25 July it will improve to
only 30% and so we will try our low power modes again then..  In the mean
time, enjoy...

We only have one priority user right now (if anyone else is on special
travel, let us konw?).  Look for N3IYI's railroad car downlinking on
144.39 over the east coast.

And during the 3 weeks begining 29 July we should have several people on
Naval Academy boats attempting to be tracked a few times a day via PCsat,
ISS and UO-22 out in the Atlantic.

Yes for the last 5 days we have tried a different power saving method to
try to make it through eclipse.  This includes turning everything except
a single once a minute 9600 baud telemetry pacekt off.  It hasn't worked.
Thus for the weekend, we are going to stop and just let PCsat continue to
operate for the users in sunshine...

When I transferred mine from my old pickup to my new one I sued that black
double stick foam tape that RS sells. Antenna works OK (actually I think it
lowered the swr)>I've used it on both the D-7 and 700.

When I had to remount my thru-the-glass antenna, I used good old RTV --- a
THIN layer on both halves, then pressed to the glass as hard as I dared,
then held it in place with duct tape.... it worked great... so good, that
now that I want to move the antenna, I am afraid that I might break the
glass to peal it off.

Bob

The latest version on PocketAPRS specifically supports the Magellan GPS Springboard. Check out http://www.pocketaprs.com for details on it. Mike really packed in ALOT of support in the version for Handspring modules. I own two Visors myself and I love them. Info is on my site too at http://www.ke4nyv.com

639. [aprssig] Glass mount antennae

From: "Alan Heaberlin" <amh@QNET.COM>
Date: Sat, 20 Jul 2002 08:30:42 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

I have been using glass mounts on my Ford Ranger for 8 years, and also used them on first a Bronco then moved them to an Explorer. Though the Radio Shack catalog says they have remount kits (I think Larsen does also) my local dealer wouldn't get them for me (as an independent he also refuses to stock ANY ham radio gear). I bought a roll of double sided foam tape that glaziers use to fabricate dual glazed window units. It is very thin foam with tough adhesive. The secret is to apply a bead of silicone rubber around the exterior part of the mount so it cannot get wet and weaken the foam tape in between the adhesive layers. Removal then becomes simply a matter of cutting the silicone bead with a razor and lifting the mount with a thin blade putty knife. I have never had one come off through extreme 4-Wheeling or storm chasing. Performance has been very acceptable and seems on par with the Diamond dual-band antenna on my Lincoln. Short coax runs and careful tuning of the SWR and tuning slug are critical. I also have not noticed the need to retune the box as one lister said.

Unfortunately most of the traffic appears to be non-aprs. Just a single station using the PBBS. If someone was interested to see the APRS data from the ISS on the internet, including your gate's traffic, try www.ariss.net

Just checked the http://www.ariss.net/ page and found I am listed as being digi'd through ISS. I'm using a D7A into 75 ft of RG-8 feeding a V-42 antenna. The station runs unattended using Bobs APRSTK.

The purpose of running APRSTK was to received signals from ISS and feed them into FINDU. Being heard myself was a nice bonus.

The tape that I got is clear, and needs no other protection.
For the record, as of last night, they've outlasted my diamond 7900a
super-gainer. It's base coil shroud shattered last night, from UV exposure,
I assume.

This clear tape is a real winner, and the antennas don't suck either.

I thought there was a QST article on that a while back, but I can't
find it.. One or both of the power outputs needs a load and the
resisters needs to be capable of dissipating some heat. I will try
to find the article..

Good luck,

Robbie   wa9inf

649. [aprssig] More surplus GPS receivers on market

From: "G. Beat \(W9GB\)" <gregory.beat@attbi.com>
Date: Sun, 21 Jul 2002 18:33:27 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-90480-2002.07.21-19.12.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A number of surplus Motorola Oncore receivers is increasing.

I just received an e-mail this morning from a gentleman:

" I have been in the business of installing and servicing vehicle tracking
systems for about 9 years. Many of the early systems that I installed are
being taken out of service and replaced with newer equipment.
I often end up with the Motorola Oncore receivers from this surplus
equipment. I will probably be getting around 50 units with antennas in 2 to
3 weeks from a company that is starting to upgrade their equipment. I plan
to take some to a local Hamfest, do you think anyone's interested?"

Synergy is also having an excess inventory sale on 6 and 8 channel Oncore VP
receivers ($25 & $ 51)
http://www.synergy-gps.com/Excess_Inventory.pdf

Sounds like time to build that DGPS station or second tracking project.

Rendered body type: text/plain

Andy,

When you are powering something like a hard drive you will not need the 5
volt "dummy load" that other people mentioned. That is simply for testing the
power supply. All you have to do for an ATX power supply is bring the power
on line low. It's usually a green wire in the middle of the ATX connector.
Look on google.com for ATX Power supply pinout for further details.

Works great, I use that "trick" for powering 10,000 RPM SCSI and Fibre
Channel drives with small 150watt E-Machines power supplies.

-Jim KB0THN

I have a 2000 Blazer with factory installed sunshade (dark) windows. Will
this affect the use of a window mount antenna?

Any enlightenment will be appreciated.

TIA

There isn't a 'blanket' answer that I know of. It really depends on the
material used in the windshield.

You might try browsing some of the cell phone sites. A while back,
I remember seeing one of them that had cars listed by what worked
and didn't for cell antennas on the windshield, but I don't recall where
I saw it. And I don't recall if they had generic info on all the windows
on vehicles.

Mike

Q: How much does window tint on a vehicle really effect
a glass mount antenna?
A: OEM window tints vary widely, and most have been found
to be acceptable based upon final installations. Ford
Instaclear▯ is a product that is known to degrade
performance. Any after-market tint should absolutely
be trimmed away before the "On-Glass" installation.

The full FAQ can be found here...

One thing to think about is the new metallic tint being used in luxury vehicles. I know that Audis are particularly noted for this. The metallic tint blocks the use of tolltags and other RF devices, and I bet they'd wreak havoc with a glass-mount antenna (probably just short the conductor to ground).

How true!
The windows are OBAQUE to RF. I have a Pontiac Transport (Chevy Lumina,
or Olds Silouette) and that model has a HUGE dashboard that is almost
3 feet by 5 feet under that very HUGE raked back windshield.. You can
put 10 radios on your dashboard and still have room for more... But GPS
with all that sky wont work AT ALL.

No, I dont travel with radios on the dashboard, just telling you how huge
the windshiled is and how totaly RF shielding it is. Since the rest of
the car is PLASTIC, however, I just put the GPS between the driver and
passenger seats and it works well...

I made my first trip to dayton back in 1993 or 4 with my first tracker on
the dashboard and when I got back and looked at the capture file, the GPS
never got lock once in 500 miles...

Oops! This is why, on my Expedition, I pulled out the hole saw and knocked 13 holes in the roof for all the antennas. Sitting in the center of the roof is an Antenex NMO-mount GPS puck (black, of course, to match the other 12 black antennas on the roof and two on the hood), and it works exceptionally well. Plus, the coax run is RG-58, at least marginally better than the too-popular RG-174.

Check the manufacture of the on the ant you want to use, They will give you information on the type of window it can't use on. Then simple check the logo on the glass.

I have two mounted on my tinted windows, with little or no problems at all on my S.U.V.. My glass was rated just below the manufactures cut off point for window tint.

Hope this helps
Ken N9ZIP

661. [aprssig] PCsat for everyone.

From: Bob Bruninga <bruninga@usna.edu>
Date: Mon, 22 Jul 2002 09:30:27 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-90553-2002.07.22-09.09.23--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

TO make it easier for normal APRS users to use PCsat, we are again
activating the RELAY and WIDE aliases so that anyone with a tracker can
QSY to 145.825 and work PCsat just like any other APRS digi... with no
path changes.

Three PCsat passes are currently occuring during each of these windows in
the Northern and Southern Hemispheres. This is LOCAL time...

```
       Sats 06 07 08 09 10 11 12 13 14 15 16 17 18 19 20 21 22 23 00
       ---- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
NORTH: NO44        ************ **           **************

SOUTH: NO44 ***********                                ************
```

Note, the morning ones probably wont work due to PCsat having just come
into sunshine and the batteries not being charged up enough to transmit
a full power packet. But the afternoon commute should work fine...

If you QSY your tracker, you can see if you were successful by looking on
http://pcsat.aprs.org

PCSAT willl always work with W3ADO-1
On each orbit, command stations will *try* to also activate these:

RELAY and WIDE and ARISS and APRSAT

though only the RELAY and WIDE are in common use by terrestrials...
and that is all we are tyring to do, is to make it easy for fixed trackers
to join in... Its best to stick with W3ADO-1 of course... since the
command stations might not get the others turned on each time...

I run APRSDos 824 with the Peet Ultitimeter II WX station 24/7 in the
Boston area. I just aquired a used Radio Shack WX200 weather station. This
has more features (barometer, humidity) than the Ultimeter. Does APRSDos
support this unit?

Can I send out DGPS corrections on the ham bands
for non-commercial use? If so, what band can I use? I
want to goof around with robotics and want to be able
to guide a robot around my ranch using GPS/DGPS and an
electronic compass.

My glass mounts are on the rear sidewindows of my expedition, with privacy
glass.

EEK! Who uses 174? I'm seriously considering FSJ4-50 for my roof mount
antenna.

Great. Im trying to get someone to set up a javAPRS site that shows all
active IGates on each bird...

We thought our kids at camp for a month would give us some free time.
Now after the 13th 3 hour round trip we were wrong... Turns out Son and
daughter were at different weeks, daughter forgot hiking boots, parents
day, daughter wanted her violin for talent show, 2nd parents day, son had
to go to 3 day state swim meet..., pickup daughter, pick up son...etc

Yeap, and even a commerical user could use it if you had nothing to do with
them.

See:  http://www.tapr.org/tapr/html/Fdgps.html

Also, I have seen some DGPS code for the Garmin's GPS-25/35 as well to do this.

http://www.wombat.ie/gps/
http://artico.lma.fi.upm.es/numerico/miembros/antonio/async/

Take a look at this paper:

http://www-personal.umich.edu/~johannb/shared/pos96rep.pdf

I worked at the lab for sometime and it is not as easy as it seems. You'll
likely need to intergrate a few sensor's in. And do not discount odometry.

Good luck

Jeff

APRS tip of the week:

By the way, the intended ICON for Hamfests was the EYEBALL Icon.
It is supposed to be used as an "eye catcher" for any big event that you
want everyone to be aware of...

In APRSdos ICons are drawn to many sizes and so the Eyeball is quite large
and cant miss it... Thats the main reason why it was used for HAMfests.

Bob, WB4APR

I'd like to hear whether Xastir runs on it. That'd be yet another
OS that we can claim (like we need any more!). If changes are
required to make it run on Lindows, we'll incorporate them so that
Lindows becomes a supported build target.

I haven't heard of anyone on the Xastir mailing lists trying it yet.
I think I saw one question like yours before, but no response.

Let me know if you hear something about it. Thanks.

Generally a "tint" isn't a problem, as its merely a color introduced into
the plastic sandwiched into the safety glass. Its when the glass itself is
doped with a metallic compound to reduce UV penetration that we have RF
problems.

If anyone finds that list, I'd appreciate the URL as well....

Ahh, but a few of them are using a metalized layer as the tint. I
remember
reading that the radar detector manufacturers first discovered this a few
years back, and the concern quickly went to the cell people. And I'm
sure the GPS people.

Hmm, that might be a real simple way to test. At least, the windshield or
back window. Set your GPS up so you can see signal strength outside
the car, then move it inside the car at the edge of the front or rear
window.
It might give you an idea of what's getting through the glass.

>From the technical reference area of the Larsen antenna web site is some additional information to add to the pile:

http://www.larsenantennas.com/technical/index.html

Q. How can I tell if the glass on my vehicle is suitable for one of Radiall/Larsen¹s on-glass antennas?

A. First, look near a corner of a window for words that mean "sun", relate to sun, or refer to ultraviolet or other forms of radiation. If you find terms like "Soft-Ray", "EZE-Cool", "Solar-Coat", "Solar-Cool" or similar terms, your glass is probably passivated and won¹t work with on-glass antennas. If you want to be 100% certain, and you don¹t find helpful words on the glass, ask a 2-way or cellular shop technician to test your glass with a capacitance meter.

I would think that you could tell this by putting an SWR meter in line with
an HT antenna (one that's actually matched) and bringing it close to the
glass, in the middle of the window.

If it's RF transparent, then your SWR shouldn't increase much.
There will be some effect from the metal, which you can try in a passenger
window, with the window rolled down.

I had the opportunity to play with lindows (don't ask how...) and was not
very impressed. needless to say that machine is back to running Red Hat
7.2. It appeared to me to be just another distro of linux running WINE
(which, incidentally, is included with RH7.2)

Just MHO.

```
I have finally gotten a Linux system working.  SuSe 8.0 and it came with
Xastir 0.3.3-3 I sent a message to the address listed in the documentation
```

and it was returned. How do I enable transmission to the internet? Also
what is the latest version? I have tried the xastir website but it seems
to be missing several pages.

I sent this to the Linux list but have not recieved a reply yet.

    http://www.xastir.org
    http://sourceforge.net/projects/xastir/

Latest version is 1.1.3, released today. New enough for you? There
have been worlds of changes put in since 0.3.3. I think you're
going to like them.

Any more questions, subscribe to the xastir and/or xastir-dev
mailing lists, on the first web page mentioned. Or ask me.

Dos 6.22
90 MHz Machine

APRSdos852

Error Message

"Out of memory in line 0 of module APRSPW at address 2BFB:0564"

Make sense to anyone? how can this be fixed? (Machine also has Win 3.11
on it)

thanks
Ken

Rendered body type: text/plain

I dug around their web site a bit. As far as I can tell, it is not
really a different OS, but is based on Debian Linux (probably highly
customized). Xastir should have no problems, assuming the necessary
libraries, etc., are included with Lindows.

It looks like you need to sign up with them for $99 before you can
access the download area. I'll stick with the "stock" version of
Debian (version 3.0 was finally released last week).

Commercial AVL isn't new but this looks like the first big push to sell
APRS-like position determination to the general public.....

AT&T'S "FIND FRIENDS" JUST THE TIP OF LOCATION TECHNOLOGY

The new "Find Friends" service offered by AT&T enables subscribers to
track via special cell phones the general locations of other users for
an extra monthly fee. Industry observers are waiting to see how fast
the service catches on and how the information will be used by
subscribers as an early indicator of future applications for location
determination technologies. (San Diego Union-Tribune)

APRSdos needs about 550K of conventional RAM to run. Maybe slightly more,
I havent checked in a long time....

I've seen this problem on a FT-90, but not a 2600.

The solution for the FT-90 was to put a 27k resistor in line with pin 6.

Somewhere on the net there is a complete description of this solution.

I found it: http://www.kb2ljj.com/data/yaesu/ft-100.htm

```

Not to be negative, but it would've been nice to at least see a credit to Bob and all the others (the LA digi owners, everyone who has installed APRS devices that report data, everyone who took part in developed the APRS spec, all the software developers, etc.) who have devoted a great deal of time, energy, and money to setting up the system he used for his project.

Works great here...

My configuration is:

```
OPEN:   Com1:9600,n,8,1

KISS ON: INT KISS<CR>RESET<CR>
```

Click "ON" - then Click "KISS ON"

You might have to change the KISS ON string.   I've found it sometimes needs
a click on "KISS ON" even if the TNC is already in KISS mode.   That doesn't
hurt anything.

Another trick is to make sure the port is OFF and not already being used
on the main Setup display screen.

He's not referring to the KISS mode in the program, but rather to the
separate program KIPSS ...   [I responded off list]

I've used the Hustler G7-144 for years. 7dBd of gain.
I have had one operating a 2 meter repeater and a 2
meter digi for over 12 years without a problem.

Best Regards,
Bobby

700. [aprssig] APRS+SA Satellite Object like APRSData?

From: "Michael J. Wolthuis" <wolthui3@msu.edu>
Date: Tue, 23 Jul 2002 16:17:04 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-90725-2002.07.23-15.55.57--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I heard information that an addon exists for APRS+SA to make it function as APRSData does for sending objects to the local RF. I am currently running APRSData, but would like to try running this with APRS+SA, any information on such a program would be great! I tried writing a few people off this list with no responses.

Thanks,
Mike

```
Robert:

Our club has a number of Digipeaters and repeaters (about 60) up in Texas.  Our favorite weapon is the
Decibel Products DB-224 for VHF.  This is a 4 element loop antenna with a grounded mast.  We take a lot
of lightning and these seem to survive the best.  In Houston, due to the caustic elements in the air
(Ever seen stainless steel rust???) we use commercial Stationmaster fiberglass antennas.  Unfortunately,
 both of these are quite expensive new, but worth every penny if you compare the cost of a tower crew to
 climb 500' and replace a bad "Ham Grade" antenna that dies after a year or 2.  Many of our antennas
have been in the air since the early 80's.

If you can find a surplus DB-224 cut for the 150-160Mhz range, just order a new phasing harness from DB.
  The elements are close enough to use.  If properly refurbished with new stainless hardware and
chemical treatment or sandblasting, these will work like new for a long time.  Be sure to put Aluminum
tape over strapping tape to hold the new harness on.  This protects against UV.

Good luck!

73,
Greg

TAPR APRS Special Interest Group
 <aprssig@lists.tapr.org>
Message-ID: <LYR842-90730-2002.07.23-17.04.39--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

OK, I'm impressed!

Once you get your Lindows machine connected to the Internet...

1. Click the Go Menu (giant L; lower left kicker)
2. Navigate to Programs -> Utilities -> System Utilities
3. Select "Console"
4. type "apt-get update" and you'll see it update software catalog.
5. type "apt-get install xastir" and it installs XASTIR, ax25, etc
   answer any questions it asks. If in doubt go with the default.
6. type "xastir"

You are now (hopefully) running XASTIR 1.0.0 on Lindows. :-) Whenever
a new version of XASTIR is available via APT you can repeat the above
process to upgrade.

NOTE: This should work fine _even if_ you bought a Lindows-based machine
at Walmart and did not sign up for the $99/yr Lindows.com "Click N Run"
service.

You will need to manually create an icon on the desktop, it seems.
Right click on the desktop, select "Create New" menu and select the
"Link to Application" item. Give it a name and icon on the general tab,
and set command to "xastir" on the Execute tab. You don't want to link
it to any document types on the Application tab.

Maps, WX warning counties, sounds, FCC data, etc can be dropped into
their corresponding subdirectories in /usr/share/xastir. The XASTIR
help index should give you pointers on where to find the various data.
For those familiar, I think it's not unlike WinAPRS in this regard.

You should be able to install any Debian packages this way.

You can use "apt-get install <package>" where <package> is anything
listed in Debian software packages. Here are the Ham Radio sections:
http://packages.debian.org/testing/hamradio/
http://packages.debian.org/stable/hamradio/

If you look around the Debian software directory you should be able to
find some nice graphical APT utilities. That would make future software
installations a snap. No typing commands and such. ;-)

Yea, but go to qrz.com and poke around in kb0thn's detailed listings
and you'll see a picture that looks like the same guy.  You'll also
see both Jefferson and Jarvis mentioned in portions of the e-mail
addresses.  I think we've got the right guy...

Since something like 2/3rds of all marriages end in divorce, it's not
uncommon for young people today to have "variable" last names.   A legal
last name may not be the one a child uses in real life.   If you called my
mom and asked to speak to Mrs. Fellhauer, she'd understand, but she hasn't
used that last name since 1979...

  I'm <<assuming>> that's the case in this situation...   If you look at
the QRZ bio his link is to jjeffers...and the pictures match...

```
Thanks to Gerry and Curt I now have Xastir 1.1.0 running on my SuSE 8.0
system.

 I will spend some time with it tomorrow.  Later this week I may move up to
the latest release.  Since this was my first compile of a program on this
system I chose to go with the last stable release rather than the newest
version.   I think it makes it easier to debug problems if you are working
with a known good version.

So far it looks good.

```
I called Mapsco last year to see if they would offer SA overlays as a product,
or if they'd reveal the grid coordinates.  They'll do neither.  I thought
about deriving them, but that's pretty tedious, and more work than I wanted to
put in.  It's interesting that MAPSCO sells SA, but considers it a
```

competitor. I think they could make money on 'local enhancements' to SA, but they don't believe there's volume there.

Sigh.

Maybe we need to set our net controls up to understand MGRS and MAPSCO.

Chicken! hi hi

Except for rare instances, our "development" versions are usually pretty stable as well. Of course one of those instances was when I broke something last friday morning early AM, but really, they are rare. Really.

I had it fixed by friday night.

You would do well to install the latest 1.1.3 release (the one released today).

Rendered body type: text/plain

Yep, I'm me. I'm James Jefferson Jarvis, and as Mark guessed my last night is
the wild-card variable. I would have answered earlier, but I subscribe to
APRSSIG in digest mode.

:-)

Anyhow, from looking at my server logs I see that some people have already
discovered
http://db.aprsworld.net/datamart/search.php
which is the simple web interface from my database, ala FINDU. I wasn't quite
ready for things to be opened up to the public, but that's okay. Please feel
free to explore and let me know what you think.

The source code for the parser is available from
http://sourceforge.net/projects/aprsworld/
It is licensed under the GNU GPL license, which is an Open Source license. I
also welcome any volunteers. (And I thank David Norris who has already been
contributing good code and ideas)

Some of my science fair explanations are available online at:
http://www.aprsworld.net/info/introduction.php

Notably missing is the giant map of the APRS gathered traffic speeds for LA.
I have it on a 30 x 40" printout next to be, but the TIFF file that generated
that is over 400 megabytes. Instead of making you download all that, you can
have db.aprsworld.net rasterize the map from about 500 megabytes of GIS data.
Take a look at:
http://db.aprsworld.net/mapserver/la.php

Basically the the brighter red the road then the faster the average speed
that APRS equipped vehicles traveled. An explanation of how this was done can
be found at:
http://aprsworld.net/info/giant-map-of-la.php

Using a cell phone for position location is TOTALLY different than the
Garmin technology which requires a clear view of the sky. Cell phones allow
position location in buildings, tunnels, etc. They use GPS, non-GPS, and
GPS aided position location. It is a very different technology.

Your email address 'lyris.aprssig@tapr.org' has been submitted to be
unsubscribed from the 'aprssig' mailing list.

This unsubscribe command requires your confirmation that you want to be
unsubscribed.

To confirm that you do want to unsubscribe, reply to this message so that
the words "ok 842" appear somewhere on the subject line.

Make sure that your reply message is addressed to
unsubscribe-confirm@lists.tapr.org

You will receive notification that your confirmation has been received, and
that you have been unsubscribed.

If you do not want to unsubscribe, do nothing. You will be kept on the
mailing list.

Terry,

I'm guessing that he had no editorial control over the content of the article.
It's been my experieince that the IEEE tends to downplay amateur radio
connections in the extreme.  I guess they feel that they are pros and any
connection to amateurs carries a taint. I submitted a paper to an IEEE refereed
journal have every reference to amateur radio expunged by the editor.  I was told
this was *policy* and that reference to amateur radio was uneccessary, even in
the acknowledgments. I suspect it's more culture than policy.  There are a lot of
prominent IEEE members that are hams, but you'll be hard pressed to learn that in
their IEEE bios.  You WILL learn if they bicycle, play the piano, or rock climb.

```
Does anyone have the Mic pin out of the Radio Shack 252?  This is the 25
watt rig with the 8 pin Mic connection NOT the one with the RJ-45.  I have
looked at Radio Shack.com and found the manual and it is not in there.  I
have also checked packetradio.com with no success.  I have a friend who
wants to make a tracker using a Tiny Track II with one.

I was pretty sure the 'support' page on the Radio Shack site had a
schematic for hooking up packet to the thing. It was put up almost
as soon as the radio came out once they realized the pinout wasn't
in the owners manual.

Is there any reason I shouldn't have my float charger
plugged in while actually operating my digital station ?
(stupid question time; I was due for one)
I operate a large capacity 12V battery for 10W
tnc/radio.
...just in CASE, here in N FL..

As long as it's set to the right float voltage, and enough current to get
the battery charged during the idle periods, it will be fine.
I've operated that way for years.

Quoting Richard Parry <rparry@actionware.sdcoxmail.com>:

> Using a cell phone for position location is TOTALLY different than the

> Garmin technology which requires a clear view of the sky.

Of course, yet I was responding to the title "APRS on your cell phone" and of course APRS, like the Garmin NavTalk, uses GPS. The NavTalk was the first (unsuccessful) pitch to sell AVL to the general public not the ATT method. This is what I was responding to.

>Cell phones allow
> position location in buildings, tunnels, etc.

Actually cell phone technology, as ATT is pushing, only allows tracking to the location of the cell tower the call is being recieved on. In a rural area's this could be off by miles. I don't think they are offering any kind of multi-tower triangulation.

> They use GPS, non-GPS, and
> GPS aided position location. It is a very different technology.

Yes, of course, yet it is what APRS uses (please see title). Even so, GPS can be more accurate (for example, the GPS-35 has a rudementary dead reckoning ability if it loses signal), in particular in rural areas. The other thing is that a GPS system is voluntary... I know I am sending position reports, with celluar technology if it is on, like it or not, potentially you can be tracked.

My comment was strictly to do with who was first in the consumer market place. Garmin beat ATT there.

AKA Vicinity tracking in APRS.

I wonder if some of the Cell Sites are in ID mode while others are NOID...

Sorry - I couldn't resist...

Rendered body type: text/plain

Why does Xastir 1.1.3 start normally begin to display icons of stations from the APRS IS then within about 30 seconds of startup it dies completely. I mean it closed down and is gone. It can be restarted but again dies after about 30-45 seconds. No warning and no error messages that I can find. Any suggestions as to where to look for answers?

What I find humorous is that the story was in the San Diego Union-Tribune.   If anyone has ever tried using a cell-phone in and around San Diego, especially north of Miramar, they'll find how maddening that can be.   I think AT&T, et al should work on improving coverage, before adding fancy features.   Verizon should change their ads in SoCal to "Can you hear me yet."   It's frustrating to be standing in the middle of an open parking lot in Poway, and not be able to get a cell signal.   You can't track what you can't hear.

Although most people think the E911 edicts only apply to wireless communications. There are increased reporting requirements for public schools. From what I've read and been told, every classroom in a school building will have to be pinpointed by the E911 system (PBX E911). That basically means every classroom with have to have its own telephone and phone number. This is a huge burden on taxpayers and strains the availability of already scarce local phone numbers, with dubious safety benefits.

http://www.fcc.gov/911/enhanced/

Not doing that for me.

Try "xastir -v2047 &"

That will turn on all debugging, which means you might be able to
scroll back and see what happened just before it shut down.

Anyone else seeing operation like this?  Can you explain it?

If it's started in xinitrc (or otherwise in the background without a console
to attach to), then if it is core dumping, the window would just disappear and
nothing else would visibly indicate the problem.  He should probably start it
in a window with -v2047 and not in the background, and let it run until it
dies and the last lines of output should indicate the problem, and especially
if it dumps core, there should be a termination message courtesy of the shell
indicating what signal caused the exit, and a core file should be left too...

Rendered body type: text/plain

```
The next 3 weeks are critical to PCsat demonstrations.
We need all IGates operational if possible...

We will have several students and at least one Skipper
out on an ocean cruise with only a Kenwood HT inside the boat with a tiny
RG-174 dipole taped to the inside overhead of the cabin.

Tests today show that the one installed on N3FB's boat (W3ADO-8) got at
least 60% of its posits through PCsat but only one of them made it to the
pcsat.aprs.org web page...

Also, there is an APRS WX instrument installed yesterday above 75 deg
latitude at a camp up in the arctic circle that we hope to see as well.
It will downlink on 144.39 using PCsat's special user uplink channel. Also
there  are at least 3 other users who have requested uplink access that
are  on wilderness travels that will be using PCsat these next few weeks.

I'm packing tonight for the Canadaian RAC convention in BC so cant look up
all the calls...

For those of you who haven't noticed, APRS in Arkansas is finally taking off! We have seen quadruple digi/users over the last several months and many many more are "talking it up!"

We are also incorporating APRS into SAR teams here in Arkansas. Benton County, Washington County and Howard County SAR teams are building tracking units for their search teams. APRS will be used in the command post to keep a real-time track of the teams in the field. In Howard County every member of the team is required to have a ham license or actively working to get one. It Washington and Benton Counties, ham radio operators are a part of the teams. We are very excited about what is happening here with APRS in general and as a tool in SAR.

As an instructor and 10 year user of APRS, I am very pleased to see the interest in amateur radio and this part of our hobby! I would like to hear from others out there that are using APRS in support of SAR. I am most interested in seeing who you've developed your program and how you've handled a few hurdles that SAR presents!

Well, we have'n fun in Arkansas!

73 de Scott, W5JSR

He had these ar the Orlando Hamfest earlier this year.  I bought a number
of the complete units from him and sold a number of the GPS units to cover
my expenses.  All of the GPS engines had the latest firmware and all
worked.  The HF unit is, I think, a 10 Watt unit. It is controllable in one
Hertz steps.  If anyone is interested I can locate the URL to the FCC data
that was filed for acceptance.  The complete system transmitted GPS data
back to the control point on HF, it allowed the control point to send
messages to the truck via subcarrier on the FM broadcast band.  The FM
receiver scanned until it found a valid subcarrier.

The ARRL filed with the FCC a complaint over the use of HF and got a
consent from Terion that hams bands would be excluded from the frequencies
available.  In the FCC documents is probably enough data to understand the
workings of the unit and to partially control it.

738. [aprssig] PCsat HT Sailboat UPlink test

From: Bob Bruninga <bruninga@usna.edu>
Date: Thu, 25 Jul 2002 12:22:55 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-91034-2002.07.25-12.01.44--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
As a data point for FM Satellite OPS with a 5W HT and 0 dBd gain omni
antenna, we now have had 4 PCsat passes over our test boat with a TH-D7
APRS HT connected to the boats GPS and a RG-174 coax dipole duct-taped to
the inside of the cabin roof.

Success rate on these passes has been on the order of 60 and 75% for every
packet transmitted (when satellite was above about 7 Deg).  We used
```

once-per-minute for these tests. But the design goal of PCsat was for a 2m rate for such off-shore or wilderness travelers. There were on the order of a dozen other users at the same time.

Thus for our design goal of one packet every/2min, and say 50 users, we would still have a good chance of capturing a position/status from our boat once a pass... (the http://pcsat.aprs.org site does not yet capture all of them, due to not enough IGates listening, but if we monitor the donwlink directly, we can get most of them...)...

I wish I could take more data, but I am leaving in 1 hour for the RAC convention in Vernon, BC, so won't be in the same footprint as the boat test (W3ADO-8). We hope to leave the test running for the next 3 weeks as the boat cruises the Atlantic..

The Radio Amateurs Convention in Vernon BC, has an IGate, so if you get bored this weekend you can zooom in to Vernon on any of the APRS web-pages and watch the goings on... Vernon is about 5036N, 11915W

APRS Igate operators,

Im trying to scare up some more IGates for ISS and PCsat, and some people

not familliar with APRS are asking how to do it. Im leaving for the RAC
convention in 30 minutes so need someone else to help him out...

Subject: Re: [amsat-bb] PCsat IGates

Hi Bob,

What software do I need to run to put up an Igate for PCsat. I can stick an antenna on the roof here at work in Hauppauge, NY (N40.82, W73.20) where I have a full time internet connection. I looked around on a few of your sites but didn't find a "how -to" write up. I only played with APRS once to see what it was about so I may not fully understand it enough to see how simple it probably is.

TNX,
Howie AB2S

Dale,

I'm behind in my mail but.. When I read about the latest version of aprsd and your comment on 25th June I'm little conserned.

> Also, if a packet is received with the UI-View "callsign,I" construct
> present aprsd will replace it the the qA.. construct.

I don't think any APRS IS server or igate should ever change a packet that it see, it should always pass it as is. (Wrong and/or dupe should be dropped) Of course should a gate add his portion at the end of the Path. If the "callsign,I" is in the path it means the packet is already injected in the feed and aprsd should not change this before forwarding it. That mean we suddenly have 2 different packets for the same original and further dupe checking will fail. We have seen several problems with this before, for example Mic-E conversion with and without time stamps and 8-bit characters dropped etc.

Have just started to use uiview and like it's features. Is there a url for a large scale map of the state of Virginia somewhere? Have been searching the net with no luck. Also, how do you clear the stations from the screen? Understand that several of the mapping programs would let me zoom in and am looking for a workaround until I acquire one.

thanks and best regards,
Bill

You can generate all the fixed (non-zoomable bitmaps) maps you want either by:

A) Using UI-View's Mapgrabber to screencap maps from Delorme Street Atlas (classic versions - not the buggy "Deluxe" version).

B) Using Chris Vangorp's excellent freebie UI-View accessory program Maptool that grabs ready-to-use and calibrated maps from the Mapblast website (The same site that provides the maps you see in Findu). Download it from either the UI-View Yahoo group file library, or from the author's website at:
    http://home.kabelfoon.nl/~cvangorp/

> Understand that several of the mapping programs would let me zoom in and am

>

UI-View 32 has an available add-on, UI-Point, that will plot UI-View data on Microsoft's MapPoint 2002 program (this is a Street-Atlas type program with zoomable, vector-based maps of ALL of North America -- includes street-level detail in Canada and major roads in Mexico as well as all of the US.).
UI-Point WILL NOT work with the freebie 16-bit version of UI-View

```
Your other alternatives for zoomable maps are:
APRSplus (Uses Delorme's Street Atlas Ver 4 through Ver 9 -- won't work with
the horrible new "Deluxe" version of SA)

WinAPRS (Uses Undertow Software's Precision Mapping -- also a CD that covers
the entire US.  Current WinAPRS Version 2.6.1 only works with PM Ver 5.0.
Earlier versions of WinAPRS only worked with PM Ver 3.0 )

APRSpoint (New kid on the block -- also uses MS MapPoint 2002 -- actually
APRSpoint is an add-in to MapPoint)

```
I want to clear up one thing: what factors are used in dupe checking by
APRS servers.  At a minimum, APRS servers use the FROM call-SSID and
packet payload (all after the colon) for their dupe check algorithms.
javAPRSSrvr also uses the TO call-SSID because it can represent data
(Mic-E packets, for example).  To my knowledge, no server software uses
the VIA call-SSIDs for dupe checking.  To the rest of the server
authors: please correct me if your software does use the VIA call-SSIDs.
The reason for ignoring the path part of the header is because the very
nature of WIDEn-n and TRACEn-n operation mean that the path can be
modified on RF, let alone on APRS-IS.

There should also be no interpretation or modification of the packet
payload.  Some servers/IGates currently modify payloads to eliminate
trailing white space or to change 8 bit characters to 7 bit.  These
packet modifications, while IMHO are ill-advised, can be accounted for
in the dupe check algorithm.

This is not an endorsement of the aprsD qA.. algorithm or of any of the
other IGate identification algorithms.  I just wanted to clarify how
dupe checking is done so decisions are made based on correct
information.

Move your mouse pointer over a station and right-click - from the drop-down
menu left-click on delete station.

I would also like to point out that UIView is relatively inexepensive to
register in the U.S.   It's about 16 bucks for the 32bit version.  Works
great with Soundcard AGWPE.  And UI Point is awesome.

The problem with other mapping software is that they generally only offer
street level maps for the Continental US.  Alaska, Hawaii, and the 51st
state (Canada) are left out.  MapPoint 2002 gives you street level maps for
when you want to zoom in on that guy (or gal) driving around Montreal or
Manitoulin Island.   Plus they have European versions, too.   Although
MapPoint (USA) 2002 doesn't give you street level maps worldwide, you can
zoom in on any country/continent on the globe and see major geo-political
boundaries and where major cities are located.

The only downside is that plotting APRS stations on MapPoint 2002 is slow.

>APRSpoint (New kid on the block -- also uses MS MapPoint 2002 -- actually
>APRSpoint is an add-in to MapPoint)

APRSpoint is a little skimpy on features, but that may not really be a
negative factor for many people, especially those just getting started in
APRS.   I really like the program, and look forward to some creature
feep...  ;)

I'm still waiting for an X-10 interface or plug-in for any APRS program
that would allow you to trigger and X-10 event based on some received APRS
activity.  Like a station coming inside a certain range from your station
or other geographic point, a reported wind speed or temperature variation,
or an emergency beacon being received.   For instance:  I set a parameter
of radius 0.5 miles around my house, if a station beacons a position inside
that range, the APRS program triggers and X-10 event through a CM11A X-10
controller (like A-5 on).   And if the station then leaves the proscribed
radius then it could trigger another event (like A-5 off).

And yes, I'm aware of MisterHouse and MHATS, but that's X-10 software with
an APRS plug-in, not an APRS program with an X-10 plug-in.  Furthermore the
learning curve on MisterHouse is about as steep as it can get.  You pretty
much need a doctorate in computer science to download the program, and then
have an MSCE and Perl programming experience to use it...

That's for an individual station. :-)

To remove them all, select Station List, hold down the Ctrl key and click on Delete.

Maybe with real audio plus? But I do know the following shareware
program will do what you want:

http://www.totalrecorder.com/

It has plug-ins to convert it to MP3 so it should be ideal for your
CD player.

Good luck

-Jeff

The ,I is something that was just implemented without any agreement. It
has problems which the qA structure addresses. This also is not
formally approved by the APRS WG, but the general form has the
agreement of the people with the greatest understanding of the APRS IS.

Dale's program is a beta version, with the intent of finding any hidden
problems with this new construct. For that reason it is important that
the data be as conformant with the spec as possible. Therefore the ,I's
are converted to the new format.

```
All I can say is wish I was there. This is convention week for the
Experimental Aircraft Association, Talk about a mass of humanity. Havent
made it there in a couple of years but taking into account potential
inaccuracies of aerial views and such the Nocall may be a visitor since
I zoomed out to about 3 miles and the signal is very close to the
airport and campgrounds, or he could just be  a local. Just seems like
one heck of a coincidence that he is that close to wittman field. That
would be the ultimate fox hunt right now. The campground touts something
like 30,000 people in a very, very small area.  hummm, maybe that is why
I havent been in a few years.

     going to bed, took the kids and the xyl out about an hour ago and
watched ISS do a near overhead flyby. My little ones got a real kick out
of it we then came in and I showed them some pictures of what it looked
like up close.

Steve, what is the purpose of a 'new format' that changes an existing
format, approved or not?
Is the 'I' not serving it's purpose effectively and completely?

Good question. Be nice to see updates as to what's happening. The main system has suffered long outages, and it's usually when Steve is traveling and can't access the system.

As a general update, The last set of donations were processed late last week and the final total is at $6700. I have built a new page with names but have not finished it yet. Clint has been given the paperwork to place the order. I found out last week that the original cart we speced out had expired. The final total has given use more room to work. I will follow up with Clint today and get the order placed.

I've used radio-mobile in the past to plot repeater coverage, but according
to the following usenet post, it's gone even further and added aprs support!

::POST FOLLOWS::

Came across a link to a neat radio propagation prediction program. It's
a little hard
to understand and get running at first, but worh the effort.

Radio Mobile is freeware software that is a tool used to predict the
performance of a radio system and draw maps. It also now handles APRS.
Thanks to the space shuttle SRTM mission that occurred in february
2000,
elevation data of high quality will be released for the public for most
of
the world.

Chris,

You can search the archives of this mailing list, as the topic has been
beaten to death.
(Someone may offer a good search "key" since you didn't get much last time)

There are two opinions, "yes" and "no". Take your pick, with all the
variables considered. Do us all a favor and DON'T write the FCC and ask
their opinion. Never ask a bureaucrat a question that you cannot afford to
hear a NO to. The bureaucrat's first instinct is to always say NO.

I'm not sure there is an easy answer. You will likely hear "absolutely not",
"sure, go ahead", "do it with caution", "do it at your own risk", "call the
FCC" and any number of other responses. Don't take anything said by people
who may respond to your query too seriously. (The arm-chair "regulation"
experts seem to hang out on ham lists, with far too much time on their
hands.)

The primary issue appears to be "control" and how long a time it may take to
assert said control over your aprs tracker, should it misbehave. How to
assess this is a matter of opinion...and that's all your going to get in
response is someone's opinion. It's your ticket at risk, and you'll have to
decide how much risk you might be taking, or are willing to take.

There are several schools of thought in approaching the problem:

1. If there is ANY doubt, don't do it. (Never take any risks.)

2. If there is ANY room to wiggle, take it. (Take as many risks as you can
defend)

3. It is better to do what you want and apologize later for your ignorance.

(I knew it was "grey", but really wanted to do it and am willing to be warned)

4. No matter what, don't explicitly violate an interpretation you requested from FCC.
(This is why you NEVER want to ask the FCC about something doubtful, but not obviously in vioation of the regs.)

While this doesn't explicitly answer your question, it does give you a way to analyze the plethora of "answers" you are likely to get on this list.

Bottom line? No one knows for sure.

But, one this IS for sure.

If you may not like the answer, don't ask the question.

If you DO happen to do it, just remember who the control operator is, and what he's hanging out on the line!

Mike

A side issue but one can use APRS and the infrastructure without using the ham bands... it is fairly trivial. MURS, CDPD, AMPS (Navtalk) and even roaming 802.11b can inject posits into the stream (and into FindU). None of these require a license and MURS is a good fit for the APRS model (except you can't use digipeaters).

No, it is not, there are problems with the way it was designed. I made tmyhe objections at the time, but it was simply implemented. The point of the new method is that the callsign is added by the hub based on who the connection is registered to, rather than a user specifying it. In other words, change the hubs rather than the dozens of existing user programs, and you have complete tracability, rather than the ,I system, which will fail forever with non-upgraded programs. Furthermore, if a new validation system is ever implemented, this method allows completely traceable chain of responsibility.

The q construct is much more effective at its purpose.

But this can also be added by the IGate and the server will not
overwrite it.  Nor should it because there may be multiple servers that
the packet passes through.

> other words, change the hubs rather than the dozens of existing user
> programs, and you have complete traceability, rather than the

????  What will fail, Steve?  I understand adding the qAC if no ,I is
present.  But the system won't fail if a ,I is present and not
converted.  So the question still stands, why modify a perfectly usable
construct?

> new validation system is ever implemented, this method allows
> completely traceable chain of responsibility.

Not necessarily in a multi-tier architecture.

My recommendation, to simplify matters and to continue to support
working software in the field, is:

Keep the TCPIP*/TCPXX* constructs for APRS-IS originated packets
(validated/non-validated).  They already identify the originating
station.
Allow the ,I construct to pass unchanged.
Only identify packets with neither of the above constructs with the qAC
construct if the packet is received over a verified connection.

This proposal meets your traceability requirements.  Until a coherent
document backed by an organized APRS-IS WG is formulated, problems will
continue to exist with adhoc implementations "better ways".

That is exaclty the point, with the q construct you have tracability
and can see exactly what the packet path was through the APRS IS.

The q construct serves important functions besides identifying the
IGate of origin. It provides a foolproof method of loop detection, if
all hub software implements the algorithm. It provides methods of
automatically characterizing the sort of packet it is. It would be
possible to write an app that dynamically maps out the APRS IS, showing
the where misconfigurations are occurring. These functions depend on
all the hubs implementing it. If only some do, it won't work!

> usable construct?
>
What fails is that many people will not upgrade, so those non-upgraded
IGates remain forever a thprn in the side of those trying to maintain
the system. The q forms a separator between the RF path and the
internet path, making automatic tracking and loop prevention easy.

> > new validation system is ever implemented, this method allows
> > completely traceable chain of responsibility.
>
> Not necessarily in a multi-tier architecture.
>
Yes, in any architecture. Give me an example that would fail!

> My recommendation, to simplify matters and to continue to support
> working software in the field, is:
>
> Keep the TCPIP*/TCPXX* constructs for APRS-IS originated packets
> (validated/non-validated). They already identify the originating
> station.

I do not dispute this, it was the basis of my argument that the third
letter is redundant (as is the second, a simple q would represent the
first version of the q construct, if another letter were added to
fulfill some function then a version byte might be needed.

> Allow the ,I construct to pass unchanged. Only identify packets with
> neither of the above constructs with the qAC construct if the packet
> is received over a verified connection.
>
I strongly disagree. The I format ONLY identifies which IGate injected
the packet. It does nothing for loop prevention and automatic mapping
of the APRS IS.

> This proposal meets your traceability requirements.
>
No, it does not, it does NOTHING for the tracability I care about,
withing the APRS IS. A packet entering a 50th tier hub (not that they
exist, but do we really know? I have seen 7th tier in Europe) looks
exactly the same as one entering at the first tier, there is no
tracability within the APRS IS, no mapping functions can be
implemented, there is no loop prevention, and no accountability if a
new authentication system is implemented.

> implemented, there is no loop prevention, and no accountability if a
> new authentication system is implemented.

Re-read the q implementation as defined by Dale in his aprsD spec. Path tracing is not done with his implementation of the q construct. In other words, additions to the path are only done if the packet does not already have a q construct. This may not be what you wanted, but it is what has been implemented. Therefore, there is no loop prevention, no mapping function, nothing along the lines of what you are proposing. I originally thought that this tracing function was what was being implemented. However, after closer review, it does not appear so. And, I think that the current definitions for qAS are lacking if it was going to be used as a trace mechanism.

This is what I expect, however, when there are disorganized attempts at making radical changes to existing networks. Many ideas on how it should be done, many conflicting, many helping, many hurting, and, in the end, little change.

767. [aprssig] findu backup credit list updated

From: "Guy Story, KC5GOI" <kc5goi@kc5goi.net>
Date: Fri, 26 Jul 2002 23:23:47 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-91266-2002.07.27-00.02.46--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have received all the names that have made donations to the backup server. If you are missing or have a correction, email me off the list servers. I also found out last saturday that there were a few checks still not run. That was taken care of early this week and pushed the total to $6700.

I wish I could tell everyone that the server is in but I found out that the original cart we had created expired. That occured due to the delay in finding the 501c3 document. The document will allow Dell to give us a break on the sales tax. Dell will quote the final price when they get the document. The treasurer for the DCARA was on vacation the week I found out that the cart was fixing to expire. We have all the documentation in place and a much higher amount that we had when the cart was built for the order.

Additional delays that have occured have been the results of work, 2 bike rides (MADD and MS150) family and other assorted "disasters" that life deals out.

Let me talk about the server instead of excuses. Clint Miller , KD5BYY is going to be the primary admin on the server. We will be third and I am looking for someone to act as the secondary. That person will need to be very knowledgeable about Linux, Apache and sql databases. I have had some discussion with Steve about the redundancy levels. Clint is an owner of Itel-Tigerbyte and specs out all our equipment. The backup server will be featuring tape backup and a small raid array. If a system failure happens and it takes out the data disk and it's raid mirror, the tape backup will save that data. The server is not going to be built by Dell with all the memory that is planned for it. Dell is very proud of it's memory upgrades and we can beat the pricing by using local vendors for memory. We orginally wanted to get a rack mountable system but that costs more than it is worth. It is amazing what a rack mount form factor can do to cost. It will have a dedicated battery backup and will talk to the UPS so if it needs to shut down, it can do so in an intelligent manner. Last thing we want is to see a corrupt database due to a bad shutdown.

The server will be located at the co-location facility in Dallas Texas. It will be connected via a T1 that links back to the Denton office. The Denton office is feed by a buisness class 1.5 megabit DSL circuit. The Dallas Co-location facility also has redundant power and generator backup.

When I have the cart that is ordered I will post it to the lists so you can see what your donations purchased. Pictures will also be posted when the server arrives.

Many hams contacted me directly offering to help purchase or find a location to make the server home. Thank you everyone for your offers. They were not ignored or treated lightly.

I want to thank everyone for being patient in this endevor. It has taken longer than anyone expected, but then again, it has exceeded most peoples wildest expections. It will be worth the wait. Spider has been instrumental in the donation collection process. Over half the collected donations were routed through him. Jim, I was not joking when I said you won the race. Brent was also a major source of donation collections with his generous offer. TAPR, as always, was a great helper and sport. We all owe these guys a big thanks at this time. The most important players have been those of you who were able to make donations. Pat yourselves on the back. You deserve it.

Rendered body type: text/plain

I'm getting ready for a cross-country trip from southern Cal to Michigan starting next Thursday or Friday. I thought it would be neat to beacon the SSTV icon on my mobile APRS setup since I DO run SSTV mobile with a live camera.

According to the official APRS standard (APRS101.PDF) the upper case letter "T" [for "television" perhaps?] is assigned to the SSTV icon.
When I set this letter into APRSplus, it shows "Thunderstorm" instead.
I noticed that upper-case-T in both the primary and secondary set are assigned to Thunderstorm in APRSplus. Furthermore, the secondary-K is shown as "unassigned" instead of the Kenwood logo as the D700 itself (and APRS101.PDF) show.

Which is more current? What would the weather guys think of a thunderstorm precisely tracking Interstate-70 across the southern Utah desert?

Should I load the bitmap set in APRSplus into a paint program and revise it? (Of course that won't help anyone else with APRSplus that sees me enroute.)

As one who has a 501 (C) (3), if you give the vendor your
TIN, that is usually sufficient. They can look it up with
the IRS, but I've never had a vendor that curious.

I've neve had one wanna see the incoporation papers, filein's
with the IRS, etc.

Too late for this deal, but for future reference.

The treasurer for the DCARA was on vacation the week I found out that the
cart was fixing to expire.   We have all the documentation in place and a
much higher amount that we had when the cart was built for the order.

Additional delays that have occured have been the results of work, 2 bike
rides (MADD and MS150) family and other assorted "disasters" that life
deals
out.

Let me talk about the server instead of excuses. Clint Miller , KD5BYY is
going to be the primary admin on the server. We will be third and I am
looking for someone to act as the secondary. That person will need to be
very knowledgeable about Linux, Apache and sql databases. I have had some
discussion with Steve about the redundancy levels. Clint is an owner of
Itel-Tigerbyte and specs out all our equipment. The backup server will be
featuring tape backup and a small raid array. If a system failure happens
and it takes out the data disk and it's raid mirror, the tape backup will
save that data. The server is not going to be built by Dell with all the
memory that is planned for it. Dell is very proud of it's memory upgrades
and we can beat the pricing by using local vendors for memory. We orginally
wanted to get a rack mountable system but that costs more than it is worth.
It is amazing what a rack mount form factor can do to cost. It will have a
dedicated battery backup and will talk to the UPS so if it needs to shut

down, it can do so in an intelligent manner. Last thing we want is to see a
corrupt database due to a bad shutdown.

The server will be located at the co-location facility in Dallas Texas. It
will be connected via a T1 that links back to the Denton office. The Denton
office is feed by a buisness class 1.5 megabit DSL circuit. The Dallas
Co-location facility also has redundant power and generator backup.

When I have the cart that is ordered I will post it to the lists so you can
see what your donations purchased. Pictures will also be posted when the
server arrives.

Many hams contacted me directly offering to help purchase or find a location
to make the server home. Thank you everyone for your offers. They were not
ignored or treated lightly.

I want to thank everyone for being patient in this endevor. It has taken
longer than anyone expected, but then again, it has exceeded most peoples
wildest expections. It will be worth the wait. Spider has been
instrumental
in the donation collection process. Over half the collected donations were
routed through him. Jim, I was not joking when I said you won the race.
Brent was also a major source of donation collections with his generous
offer. TAPR, as always, was a great helper and sport. We all owe these
guys
a big thanks at this time. The most important players have been those of
you
who were able to make donations. Pat yourselves on the back. You deserve
it.

Guy! Do not forget to look in the mirror and thank yourself for the efforts
you have
provided that will benefit those that use Findu. You've been the focal
point for this
project since day one!

Thanks for the kind words.

Jim, WA6OFT

Rendered body type: text/plain

Last week I went on a backpacking trip into the Olympic Mountains in WA. I left my D700 tracker set up in my truck as a digi with my Garmin III+ GPS attached. This makes it easier for my HT tracker to make it into the network. I use PM 5 for this setting which is set to only transmits once every 30 minutes and the display shut off. It took us just under 8 hours to hike/bushwhack into my favorite high mountain lake (Wonder Lake) in the Wonder Wilderness. Once we got there I checked the air distance from my truck with my D7 tracker from camp. It was 2.3 air miles.

The next day after doing some extensive hiking in the Wonder Wilderness, I checked my truck again and now it was 9.4 miles from my camp. I plugged my other III+ into my D7 and let it plot my truck on the GPS screen. It turned out that my truck was now on a logging road on the other side of Lake Wynoochie! Well what else could it be other than someone stole my truck and drove it to the other side of Lake Wynoochie and left the tracker running! How stupid for a car thief!

We had some interesting discussions that evening as to what we should do. Inform the Sheriff? Inform my wife? Call some of our friends to have them check things out? etc..... I decided to play it cool and do nothing until we got back to our starting point the next day which was over 10 miles from any civilization and even that was only a Forest Service Campground. Back in my mind lurked the fact that both the D700 and the GPS use microprocessors and microprocessors do hang up once in a while. So, we really did not want to alarm anyone, besides us, that my truck might be stolen.

The next afternoon when we returned to our starting point, we were pleased to see that my truck was still right where we left it! I opened the door and looked at my GPS screen which read "Invalid GPS Data, Power Down to Reinitialize!" Boy I was sure glad that I did not alert the Sheriff or anyone else since I would have looked like a fool, especially since I am working with the local Sheriff in trying to integrate APRS into our SAR activities.

Someone many miles from our location did notice that something was wrong and sent a message to my D700: "108 mph, 44000ft. Were are U?" Ah, if they had only sent that message to my D7 which I had in camp, I would have realized that it was definitely an equipment problem and not a theft of my truck! Of course it also dawned on me at that time that I should have looked at the other parameters on my "moved" station on the D7 and I would have noticed the bum speed. Yes, the speed (s108) was available to me on my D7 but it was not a thing a thought about looking at. I am sure I will next time.

There were two lessons learned from this experience:

1. Our modern electronics/microprocessors do hang up once in a while, so do not jump to conclusions until you verify the real problem.

2. If you see someone's tracker out there doing some strange things, don't just send a message to that tracker, but also send one to the same call sign on an HT tracker that is/was located in that same general vicinity. Also try voice communications if they are sending out a repeater frequency in their data string.

I am sure if I ever run into the problem of my truck having changed locations again when I am in the high county, I will just say to myself: "Ah, I have seen this before" and ignore the situation. I sure hope that it will be a similar problem and not be surprised when I come back out and find my truck gone! Hi, hi....

You can't see ANY...or you don't see as many as you think you should?

> I can see half of what's transmitted.

Transmitted by you, or transmitted by others to be received by you?

> Bug?, or I have something set wrong/not set.

Bug in what? You don't tell us what software you are running. The APRS clients I'm familiar with don't have any bug that would cause what you are seeing, but I'm only guessing because I don't know what your setup is like.

There are a lot of people willing to help (me included), but it is very easy to get frustrated when the question leaves one guessing, and no mention is made of the radio/tnc/software program that we are allegedly going to try to help with.

If you want help, provide at least the basic info.

1. What program are you running?
2. What radio and tnc combo are you using?
3. Do you see ANY packets/stations on the screen?
4. How did you set your squelch/volume to the TNC?

Short of a bad connection, I'm betting on number 4, but I've never won the lottery.
<g>

More info PLEASE!

The MONITORED PACKETS, off the air (2M), will only
show about HALF the text, the rest is OFF SCREEN, to
the LEFT side of Map window, and is UNreadable.
HALF of monitored packets show up, the rest is cut
off.

Herb -

I thought it was quite nice for "ET" to bring your truck back to where you
left it
..... after borrowing it (that explains the GPS altitude and speed).

Are you sure you did not find a bag on Reese's Pieces on the seat?   :-)

Hmm.  My D700 will receive any message sent to my call, whether or not the message was
addressed to the D700 SSID or not.  I think it's a feature and is documented in the manual.
I assume the D7 is the same.

Also while we are on the subject, if you know the person you're sending the message to has a
D700, go ahead and use the % as the first character of the message, just in case that person
has a speech board installed.  That would make my day.

Dick R.

Still have no idea what program you are running.

I think anybody would be hard pressed to help you without knowing this
crucial piece of information.

Also sounds like the resolution on the monitor may be set wrong,
like 600x480 instead of 800x600?

Again, just guessing since not enough information given..

What's the forward VHF/UHF stick?  I'm running a Diamond SG7900.
It's a bit tall, but great gain.  I worked out a mount for it, at
http://www.inchase.org/outflow/events/installnic2002/f5Mount.html

I've not run HF mobile, all my activity has been on VHF.

Yes indeed!  Roger has a SUPER PRODUCT using UI-View32 and Precision Mapping
V5.0.

You can do just about everything needed with this new release.  I just can't
beleive he choose to keep the price at $15.00!
I think PMaps is about $49 or $50.  So for about $65 you get an APRS mapping
setup that is stable, easy to use and just works awesome!  And I am pretty
sure you can order Pmaps through a link on his web page, www.ui-view.com .

During the Beta testing of this release, I have had the oppertunity to demo
it in front of several FEMA, BIA, State and County officials visiting and
involved in the area LEPC.  We were showing specific information
(FIRENET,METAR,etc), using UI-VIEW32 and PMaps and they were very impressed.
(btw during the demo, a Sat went by so they got to see that too!).
I guess the next best thing would be GIS interfacing...but I think we'd be
looking at really big bucks!

Jim

Talk to me boy!   ETE-2 is sitting in the county EOC radio room, and will
be running UI today.

I'm very interested in expanding it's use.

Front antenna is a Comet 2M-UHF-800MHz that I use simultaneously on the Kenwood TM-742 2M and UHF bands, and on the LA County EDACS 800 MHz trunking system using a Comet 3-port triplexer. Or with a 800 MHz cell phone. You should see what 10 dBd gain at 800 MHz does for the range of a classic 3-watt bag phone! A friend's wimpy Verizon Nokia handset got into a cell site 25 miles away with it!

The center one is a Comet SB-14 6M-2M-UHF. It handles the 2 and UHF outputs of the D700 along with the 6M output of the TM-742 via another (different) 3-port triplexer.

The back one is the Yaesu ATAS-100 autotune screwdriver that tunes continuously from 40M thru 6M and also works after a fashion on 2M and UHF so it covers all the bands of the FT-100 except 80 and 160.

Finally you can see the stupid OEM active AM-FM whip that overloads anytime I transmit on any band. would have much rather had a classic passive whip on the front fender but the EMI-RFI from engine control electronics is so severe nowdays that everyone is trying to place the broadcast whip as far away from the engine area as possible...

At the lip of the tailgate is a Tri-M Engineering SuperSkymaster GPS. That white device is the entire GPS system including the 12-channel receiver, not just a patch antenna. It mounts through a single 3/4" hole. You feed 5VDC into it and RS-232 NMEA 2.0 data comes out. No feedline loss at all and no overload problems from amplified active GPS antennas!

If you are running winaprs, I had the same problem with 2.4.6. I could only receive less than half of a transmitted message/packet in the bottom of the map display, the first part of the text was hidden behind the left side of the screen. I also had problems getting the last half of the messages in the message display. upgrading to 2.6.1 took car of that. Just a thought.

Can anyone tell me if the M10 and GM-300 will go down to 144.39 ?
Any degradation in performance ? I just got a handfull of them and
was interested in using them for APRS.

Rich!  I forgot to tell you, the GM300 is normally an 8 channel radio.
However, it is REALLY a 16 channel radio...and is only limited by the
programmer!!
All my GM300's have 16 channels in them.
The MaxTrac's and M100/GM300's make excellant APRS Radios.  Two of them and
a thing called a RIC make excellant portable repeaters too!

My father in law just got a new sprint phone which has GPS built in.  It
appears to use the PCS antenna for GPS rx as well.  Pretty neat, and pretty
tiny.  My question is: Does anyone know how to track the location of this
phone via the web?  I can't find it on Sprint's web page.

Of course you know the next killer app will be to have a server "pull"
posits from a list of phones and x-late to aprsIS.

Already doing it with the commercial AVL unit I won from Earthlink, very easy:

http://www.findu.com/cgi-bin/track.cgi?call=avl&geo=usa.geo&start=9999

You can compare the track for the D700 on trips to Virginia and Boca Grande:

http://www.findu.com/cgi-bin/track.cgi?call=k4hg-8&geo=usa.geo&start=9999

The AVL was transmitting every minute, the D700 every three minutes,
and the winner is easy to see.

There is a ham that has a wireless GPS device, and I've used it to
check his position, it would be quite easy to add it to findU, but he
has no need for it, as it cost him $$$ each time it was checked. If
anyone has a device like this and wants this feature just let me know.

The devices that have email connectivity and Palm or Java
programmability could easily be made to email their reports to findU.

```
I think that these are the perfect radios for trackers.  The M10 is the
single channel version of the M120 (2 channel) and GM300 (8 to 32 channel.)
The sixteen pin connector on the back will provide all the connections you
need if the radio is properly programmed and jumpered.  Digi-key has the
connectors and contacts.  Drop me a note for the part numbers, they aren't
in the catalog.

http://www.batlabs.com/gm300.html

Do any of them need new homes?

several points .....

 (1) the whole problem could have been avoided by 'capturing' the current
GPS posit into a position buffer, the setting GPS input to 'not used' and
shutting off the GPS. if the truck is parked it is not needed ... of course
if it had been stolen, you would have lost the tracking ...

 (2) any message to KB7UVC, regarless of SSID will be displayed on any
D7/D700 regardless of SSID, the only thing that will be done differently
will be that the unit with the matching SSID will be the only one to ACK the
message. If your D7 was on the whole time and you didn't get the message,
then you weren't in a position to get it, regardless if the SSID had been
right!

Subject: [aprssig] APRS False Adventure

Last week I went on a backpacking trip into the Olympic Mountains in WA. I left my D700 tracker set up in my truck as a digi with my Garmin III+ GPS attached. This makes it easier for my HT tracker to make it into the network. I use PM 5 for this setting which is set to only transmits once every 30 minutes and the display shut off. It took us just under 8 hours to hike/bushwhack into my favorite high mountain lake (Wonder Lake) in the Wonder Wilderness. Once we got there I checked the air distance from my truck with my D7 tracker from camp. It was 2.3 air miles.

The next day after doing some extensive hiking in the Wonder Wilderness, I checked my truck again and now it was 9.4 miles from my camp. I plugged my other III+ into my D7 and let it plot my truck on the GPS screen. It turned out that my truck was now on a logging road on the other side of Lake Wynoochie! Well what else could it be other than someone stole my truck and drove it to the other side of Lake Wynoochie and left the tracker running! How stupid for a car thief!

We had some interesting discussions that evening as to what we should do. Inform the Sheriff? Inform my wife? Call some of our friends to have them check things out? etc..... I decided to play it cool and do nothing until we got back to our starting point the next day which was over 10 miles from any civilization and even that was only a Forest Service Campground. Back in my mind lurked the fact that both the D700 and the GPS use microprocessors and microprocessors do hang up once in a while. So, we really did not want to alarm anyone, besides us, that my truck might be stolen.

The next afternoon when we returned to our starting point, we were pleased to see that my truck was still right where we left it! I opened the door and looked at my GPS screen which read "Invalid GPS Data, Power Down to Reinitialize!" Boy I was sure glad that I did not alert the Sheriff or anyone else since I would have looked like a fool, especially since I am working with the local Sheriff in trying to integrate APRS into our SAR activities.

Someone many miles from our location did notice that something was wrong and sent a message to my D700: "108 mph, 44000ft. Were are U?" Ah, if they had only sent that message to my D7 which I had in camp, I would have realized that it was definitely an equipment problem and not a theft of my truck! Of course it also dawned on me at that time that I should have looked at the other parameters on my "moved" station on the D7 and I would have noticed the bum speed. Yes, the speed (s108) was available to me on my D7 but it was not a thing a thought about looking at. I am sure I will next time.

There were two lessons learned from this experience:

1. Our modern electronics/microprocessors do hang up once in a while, so do not jump to conclusions until you verify the real problem.

2. If you see someone's tracker out there doing some strange things, don't just send a message to that tracker, but also send one to the same call sign on an HT tracker that is/was located in that same general vicinity. Also try voice communications if they are sending out a repeater frequency in their data string.

I am sure if I ever run into the problem of my truck having changed locations again when I am in the high county, I will just say to myself: "Ah, I have seen this before" and ignore the situation. I sure hope that it will be a similar problem and not be surprised when I come back out and find my truck gone! Hi, hi....

I guess most amateurs missed the mandated changes in new cellular/PCS telephones.

For emergency purposes (911), the cellular providers needed a method to determine your location for reporting to emergency authorities. There were 2 different approaches (that I remember, without looking all of this up - again)

1.) The Sprint PCS approach: Put the GPS receiver in the phone and transmit information to cellular site
Telephone is a bit more expensive, accuracy potential high.

2.) The "cheap" method Some big names were advocates for this approach):
Cheap phone for consumer. Triangulate your position by determining the cellular sites serving your phone. Accuracy okay, intelligence & position calculations of data stream at each cellular site required.

Responses to all the replies I received:

1. Yes, I am aware of that line up but I made a conscious decision to leave the GPS connected, just in case it does get stolen. My insurance is $500 deductible and full replacement, so it does not matter if they steal just my D700 or both my D700 and the GPS.

2. I have the old version of the TH-D7A not the G. The A only captures the messages addressed to the D7. At least I have never received one addressed to my other stations. The D700 captures all messages addressed to the base call sign. I really like that feature since I can respond to messages sent to my home station when I am off hunting for a couple of weeks.

3. Are you sure you did not find a bag on Reese's Pieces on the seat? :-)
No, I did not find any. Hi, hi

4. Also while we are on the subject, if you know the person you're sending the message to has a
D700, go ahead and use the % as the first character of the message, just in case that person
has a speech board installed. Yes, I have the speech board installed in my D700. Even if the other station does not use the % to "speak" the message, the radio will "speak" the call sign of the originating station. Neat feature.

> 3. Are you sure you did not find a bag on Reese's Pieces on the seat?
:-)
> No, I did not find any.  Hi, hi

You know, years ago I saw this movie where this kid had cancer and
the dad was doing all kinds of things to make the kid have fun.

The next door neighbor bought a new (at the time!) VW bug and was
bragging about the mileage.  He was meticulous about measuring it too.

So the kid and his dad snuck over every few nights and put in a can of
gas, which caused the neighbor to brag even more about the mileage he
was getting.  For a few weeks.

Then they changed tactics, and every few nights went over and siphoned
out a can of gas.

The neighbor was going nuts...

Now, if you had a friend you liked to play tricks on, and you KNEW
he had a tracker, and you KNEW how to hang the system up, and
you KNEW how to 'fake' his packets...

Mike

All prices include shipping CONUS
Prices Negotiable - USPS Money orders preferred
I DO NOT accept PayPal payments

AEA DM-1 Deviation Meter - $60.00
in original box w/manual

http://www.timewave.com/DM-1H.html

Radio Shack 2-meter 30-Watt RF
Amplifier (19-1122) - $32.00

Cisco 678 DSL Modem - $90.00
includes all cables, 3 inline filters, one wall-mount
filter, & power supply
(I'll see if I can dig up a Commander CD for the buyer,
but it's not required for setup)
These are going on eBay currently for over $150
Currently used by many ISP's including Qwest
(Don't let your ISP foist an internal modem on you!)

HP JetDirect Stand-alone network print server - $45.00
Model 170X (J3258A)
(Wall Mountable)

Axis 540+ Stand-alone print server - $55.00
very small - mounts directly to printer port - or
you can use a printer cable extender
can be powered directly from printer (if you can solder)

Wes, interresting ideas.   It seems to me we could use an additional
service.

Your ideas here, the recent flying truck at Wonder Lake Wa. and my own
experiments have me thinking. Most everyone carries a cell phone and most
the newer ones have "text" messaging, So let the user define his
requirements like start, stop time, day of week, radius or activity, call
sign, url of the phone and msg text to be used etc... etc. and if a
transaction comes accross the IS that fit the user's criteria, send a msg
to his phone.

Why a phone, not a D7? The people I work for are still pretty much "stone
knieves" and "bear skins" and would probably fire me if they saw me
carrying a D7 or ???, but I can take a cell phone into a board meeting and
nobody cares the least, go figure?

And doesn't DosAPRS do switches someway? game port or printer port??? If
so, we could monitor the basement filling up with water or the back door
ajar, endless possibillities. Maybe some of the other progs do too?

What would we call it? WarnU? Watchit? Oh, to have DSL! or at least a
full time connection.

just a thought,
Doug/KC7IMR

Rendered body type: text/plain

I was wondering if there was/is anyone out there
with first hand experience of getting equipment
FRIED by lightning or surges....

I just bought a multi-outlet extension, with
supposed surge protection....one of the HIGHEST
Joule count....(coinsidential)..
Anyone have any kind of BEFORE & AFTER
stories to tell?
I used to work for a cable tv contractor.
  While out working in one area, while it was
particularly stormy, I witnessed a strike on a house, which came
down the Direct TV antenna (placed in a tall pine tree).
It came down the tree, through the roof, and EXPLODED an ENTIRE ROOM
full of furniture...not a pretty sight. You could clearly see into the living room
from the street, due to the circumstances, it was necessary to REMOVE
the front door of the house!

```
(TOTAL Blackness viewable from the street)

...just wondering, being the HIGHT of LIGHTNING season
here in the Lightning capitol of North America.

P.S.; If WE'RE the lightning Capitol, WHY do I
never see Lightning rods on the roofs anywhere, as I do
while driving through Virginia??!!

> Joule count....(coinsidential)..

No, what you bought is a very expensive extension cord. These devices are
next to worthless after a few months. Better you should look to a hardwired
TVSS (surge suppressor) that is connected at your home service panel. These
are well worth the investment and can divert the larger surge currents
associated with a lightning discharge.

The surge suppressor conforms to UL 1449. It will let through voltages up
to 330 VAC. My figures could be off a little, but should be real
close. UL 1449 fails to specify the length of the ground wire for testing
the device for approval. So, they are tested with zero length ground. This
gives them the best numbers to advertise. The ground must be low inductance
dur to the nature of a lightning strike (HF energy). A ground length of 5
feet will elevate the 330 VAC suppression to about 1,000 VAC. Having a
short, low inductance ground is important.

My last job was evaluating equipment damage for possibility of lightning.

Hope this helps.

The only thing that buying one of these gets you is an insurance policy. I have had good luck (saved equipment) with the Tripplite ISO-BAR series. Plus, you get either $5,000 or $25,000 worth of insurance, though I have no experience as to how well they pay.

These days, I have all of my equipment (both my personal gear and the equipment of companies for whom I consult) connected to APC Smart-UPS UPSs and Symmetra Array-style UPSs. The Smart-UPSes have a true sinewave output, as do the Symmetras, instead of the stepped approximation of the APC Back-UPSes and other cheaper devices. I've also invested in the APC surge protectors for phone lines, etc., which makes for less questions when you want to use the insurance. When I have had equipment destroyed by surges/lightning, the insurance has paid off like a slot machine. APC has a package of about 10 pages that you fill out, including a quick block diagram of the system. It takes about 30 minutes. They have paid out in the past several thousand dollars on claims I have made.

The downside to the Smart-UPS devices - they start around $500 and go up from there. I've found they're worth it.

My $.02
Terry

Ahhh, spoken like a true salesman with a vested interest in selling a specific product...

Even the $6.99 surge supressors are TVSS. What do you think an MOV does? Furthermore, Service Panel Surge Protectors are great, but do nothing to protect appliances if the surge comes from an internal source or a lightning strike to something like a vent stack or AC unit.

And not much is gonna help you anyway if you take a direct strike. If you buy a good quality power strip, usually the manufacturer will replace the strip and any appliances if they are damaged by a surge while plugged into that strip. I've had 2nd-hand 5 year-old strip-style surge protectors do their duty and sacrifice themselves to nearby lighning strikes. They work...and work well.

I'm a computer technician and I deal with lightning strike a lot, but this year has been very quiet. We've had one rainstorm in Sioux Falls in the last 60 days... But generally, from what I see, lightning induced surges produce totally random results. You can have two similar appliances on the same circuit or outlet and after a strike one will be visibly "smoked" and the other will work just fine.

Rendered body type: text/plain

Our ARES/RACES group in Mason County Washington is working on equipping our DEM (Department of Emergency Management) vehicles with APRS Trackers and is looking for some used GPS units that we could purchase at a low price (GPS donations gladly accepted). We have an immediate need to for three GPS units.

What we are looking for is Garmin units with 12 satellites in parallel technology with a connection for an external antenna so that we can connect the Trimble GPS antenna to the units. I would like to obtain one unit with background mapping like the Garmin III+ GPS for our ComVan which is the first vehicle to head out for establishing a Search Base in remote areas and mapping would be helpful in manipulating our many logging roads. The other units could be any that will output NMEA data strings for APRS trackers.

We are a low budget organization that is working on the integration of APRS into our local SAR (Search and Rescue) activities. Most of our funding comes from donation from our members however GPS units are in short supply in our organization and no one has any available to donate to our

organization. We also could use some Kantronics KPC3(+) or Tiny Track TNC's
for building our trackers.

If you have some old units that are gathering dust because you have upgraded
to newer units that you would be willing to donate or sell to our group,
would you please let me know and also let me know much you would like to get
for them. I will guarantee you that all units will be put to good use in
our SAR activities.

Thanks for your consideration,

Herb Gerhardt, KB7UVC
Mason County, WA APRS Coordinator
NW APRS Group, West Sound Coordinator

The article states, "GPS is accurate within less than a centimeter,"
however, even with SA off, isn't the best that GPS can do 10 meters (30
feet). How do they get centimeter accuracy with GPS. I don't think even
DGPS gives centimeter resolution.

I think Gerry can give a super response here... but suffice to say, there
are processing techniques that are less than real time that allow these
kinds of accuracies... that involve the phase of the signal as part of the
technique.

These are techniques that allow surveyors to use GPS accurately enough for
land survey requirements... and also allow geophysical studies to proceed
(continental drift and volcano studies)...

DGPS doesn't give those kinds of accuracies... but don't forget... these
other approaches don't use a $99 GPS... it involves lots more equipment and
processing... and takes minutes rather than seconds... to determine
position...

Rendered body type: text/plain

Frome the Man who knows this stuff.... Gerry

CAUTION: Technical content follows!

The typical GPS we (APRS practitioners) use involves use of code-phase GPS receivers to determine position. This involves trilateration (measuring the DISTANCE between 4 known stations and the unknown) to determine the near-realtime position of the GPS antenna. This code-phase determination is subject to a number of error biases within the system, which should theoretically limit the error of the typical GPS community to 29 meters. That
said, the typical GPS receiver is seeing accuracies of 5-6 meters most of the
time, if said receiver is between about 80degrees N & S. Some areas (Alaska comes to mind) are more prone to increases in systemmatic error, due to ionospheric scintillation, while others are more prone to tropospheric anomolies in areas of increased water vapor. Use around thunderstorms is "interesting" due to scintillation, as well.

Code-phase determinations are swift, and can be enhanced in accuracy by means
of "differential correction," where a receiver on a known (surveyed) sitecalculates the errors of a received signal and sends these corrections to
the roving receiver, which incorporates them, and then determines a "differentially corrected" version of the autonomous result. An improvement on the order of an order of magnitude can be realized (6m -> ~.6m) can be realized with a good differential site and timely updates.

For reference, the Military system of GPS incorporating the Precise Positioning Service, now an encrypted operation for security, theoretically is
limited to about a 14m accuracy ellipse, and has been demonstrated to achieve
submeter accuracies. With differential correction (this, too, is a code-phase
operation, but with better granularity due to differences in spread spectrum and clock differences), one can see 10-25cm accuracies.

In the case of surveying, and precise measurements of finer accuracy, one must
abandon the concept of code-phase measurements, save for initial autonomous determinations and clock and satellite acquisition, and use more comprehensive
differencing approaches that involve using a pair, or more, of receivers, with
one or more receivers precisely sited on previously surveyed (OK, there're ways around this if you're able to spend the time post-processing) monuments accurate in horizontal and/or vertical position. (Aside: Not all monuments are accurate in horizontal or vertical position at the same time.)

Using phase shift between two GPS receivers, on 2 frequencies (L1 and L2 is what we call 'em), one can accurately determine the slant-line distance betewen two site, usually, the unknown or site of interest, and a "control" station on a surveyed site. Collecting sufficient data to make a statistical
inference, one then processes the observables data between the site of interest and the various control stations, processes the results into a network of known stations and an unknown (usually a strong geometric network),
and using the method of least squares, resolves the minimum error of the site
of interest, and assigns an accuracy based on the least squares ellipse and descriptive statistics.

For a number of years, GPS techniques have elicited cm-level accuracies, usually with multiple occupations of 24 hours duration each. Vertical accuracies of 2-3 cm have similarly been achieved. Recent work has produced similar results with shorter observation durations, and interesting results with durations of observation in the 12-16 hour time range that are LESS accurate.

Real-time positioning procedures using carrier-phase approaches (real-time kinematic, or RTK) yielded typically 5-cm accuracies with selective

availability (SA) in place; today, they yield 2-cm or better accuracies.
Further, a number of commercial and free services making available RTK base stations have recently sprung up allowing Internet (and subsequent rebroadcast of same) use of RTK without setting a base station up.

Additional work in using multiple RTK base stations has initially yielded better results than reference to a single station, but are not completely verified yet.

Thus: Is it possible to get cm accuracies? Aboslutely. But you're not going to get it save by accident using Code-Phase receivers. And it's computationally intensive, and procedure driven. It ain't trivial but it's certainly achievable!

73, gerry n5jxs

> the same call sign on an HT tracker that is/was located in that same
> general vicinity.

All APRS systems are supposed to capture ANY message sent to ANY of your SSID's. But only the exact match will be the one that will ACK it. THus, your D7 should have also gotten the message (In a perfect world).

But if the D700 (with 50W) ACKED the message on the first receipt, then of course there were no retries to improve the probabilities that your HT also got it... But you make a GOOD point. Here is then a good thing we can think about...

If you MUST get a messge to someone.. Send it to one of his UNUSED SSID's. Then it will transmit many many times (with no acks) until it times out and the probabilities that ALL of his SSID's would hav ecaptured it are much improved..

Just remember to eventually kill the outoing message...

Thanks for the lesson learned!

Bob, WB4APR

I just checked my position on Findu.com. It appears the packets are being
recorded but the maps aren't being displayed. I then went to Mapblast.com
and found out that hey are temporarily down due "peering issues with their
provider". This is probably why no maps are showing up on Findu.com. Also
can someone explain what peering is?? (in simple terms)

```
I get a newsletter called the Langa List  www.langa.com .  Fred Langa is a pretty good source for
computer relate information.  The current newsletter had the following:
An Odd British Use Of GPS

I've mentioned GPS--- global positioning systems--- several times of
late, which prompted reader Gred Landerkin to send in this note about a
decidedly eccentric British application of the technology:

     Fred, A month or two ago you had a few articles related to GPS
     and it's uses. Here is a link to an article (
     http://www.wired.com/news/culture/0,1284,52989,00.html ) about
     something called GPS drawing. Basically, these two guys drive
     their car around the streets of different English cities and
     translate the GPS data into pictures (see
     http://www.gpsdrawing.com/Gallery/belephant.htm for an elephant
     in Brighton). I doubt the designers of the GPS system could
     have predicted something like this... cheers, Greg Landerkin

Thanks, Greg!

Fred has done an article on GPS, used Route 66 software and a GPS through europe.  But this is great!
Maybe someone can make "rabbits"  who said that!   73, Jerry

"Peering" in Internet speak is shorthand for saying:

"I'll take your packets if you will take my packets."

It's how data gets between the big Internet backbone providers. If my Internet connection is via Sprint, and your's is via Level3, your packets make it to my machine and vice versa by means of a peering arrangement (a contract as well as a router-to-router connection) between the two companies. If a smaller company wants to peer with a larger company, the smaller company usually has to pay the larger one. In the case under discussion, it sounds like there's a contract problem between Mapblast and their service provider.

Yes, APRS dos supports a READ and and OUT command syntax that can be sent in a message that will READ the 8 bits on the parallel port and/or set them individually for such control purposes...

See TELEMTRY.TXT in the APRSdos docs..

That means their phone line broke...or that someone forgot to pay the bill
for the T1 line...or their backbone provider declared bankruptcy and/or is
in jail...

>This is probably why no maps are showing up on Findu.com. Also

830. [aprssig] GEORGIA APRS Drill Announcement

From: John Kraus <jfkraus3@cox.net>
Date: Mon, 29 Jul 2002 18:29:00 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-91663-2002.07.29-18.06.52--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Announcement

The Georgia Amateur Radio Emergency Service will conduct an APRS Drill from
1900 to 2100 on July 30 2002.

For information on this drill and the scenario that we will be using please
see this website.

http://members.cox.net/kc4zgq/aprs.html
```

This drill will use pre-defined scripts in an attempt to test our infrastructure and to assess the level of training and APRS awareness of ARES members. This drill is not designed to test deployment or emergency preparedness. The stations participating have been briefed and given copies of their scripts. We do not anticipate taking check-ins as the purpose is to pass predefined data for later evaluation. To avoid overloading of the network we ask static stations within RF range of Georgia that plan to monitor this drill to set their beacon rate to at least one hour intervals for this time period.

For stations that would like to monitor the drill but who lack the APRS capability Mark Foley NA4V has created a webpage that will allow you to see a map and watch the messages in a text box. It can be found here :

http://www.na4v.com

Look under 30 Jul APRS Drill JAVA on the navigation bar.

If you would like to participate in future drills please make this known to your county Emergency Coordinator or to the State coordinator.

Constructive after action criticism is welcome; flames will be extinguished and ignored.

Please forward comments to John Kraus KC4ZGQ at

kc4zgq@hotmail.com

Put "APRS" as the subject or your message will be filtered into the trash.

>

AFAIK, the first person that implemented something like this was Rich Parry, W9IF, with perlAPRS:

http://w9if.net/iweb/perlaprs/perlaprs-dcc97.pdf

As the url implies, this dates back 5 years. He created a system based on callsigns within boundaries that would trigger shell scripts.

This is also very much like the weather stuff I am working on now, and tested for the first time on my recent trip to NC and VA. findU looks at each NWS weather alert and sends an email to my cell phone when a warning is within 100 miles of my position. Also, using the Earthink AVL with its two-way Reflex telemetry link, I was sending a small section of the NWS radar image surrounding my vehicle to the onboard laptop.

The weather warnings worked great, but the radar images suffered from bandwidth problems. I deliberately made each packet of 120 bytes to stand alone, so that reception of all the packets were not required to get an image, but much of the time I was looking at a very incomplete image.

Next I plan to work on a more compact form that specifically traces the expected route of the vehicle, and is short enough for use on the air.

Someday I hope to get the infrastructure done to allow this to be easily used by others, but this infrastructure is complex. I've had a couple people volunteer to do this, but once they get an idea of the scope of the task I never hear from them again...

I do think that this sort personalized information is the future of APRS and AVL in general.

>What would we call it? WarnU? Watchit? Oh, to have DSL! or at least a
>full time connection.

Don't let that stop you. It is quite possible to develop this with an intermittant dial-up connection. If you get a working system, I can host it on findU or you can ask for someone to co-lcate for you, I have had dozens of offers for findU which I cannot use, I'm sure someone would be glad to host a computer somewhere for you.

Steve K4HG

Coming on the heels of the thread on enhanced accuracy GPS, I wonder how they are getting the resolution down to the claimed yard level in this application

Price May Keep the StarCaddy Off the Green
By MICHAEL P. REGAN
ASSOCIATED PRESS

July 29 2002

At first glance, the StarCaddy appeared to be the most promising golf gadget since Rodney Dangerfield's bag spit clubs into the air, played tunes and served draft beer in "Caddyshack."

A gadget that relies on global satellite positioning and golf course maps loaded into an attached hand-held computer, the StarCaddy allows you to measure precise distances to a green's center from anywhere on a hole.

In my testing, I could see where it might help knock a few strokes off someone's game. But the $249 StarCaddy probably won't knock those $400 Callaway drivers, or a snazzy pair of knickers, off the top of my golf wish list.

Then again, I'm too cheap to pay for a real caddie, let alone a satellite caddie. I suppose if I were a duffer with deep pockets--and just a modicum of tech savvy--I'd order mine today.

The StarCaddy has a global positioning receiver that plugs into most PDAs, but if you have a compatible GPS receiver you can buy the software alone for $49.

Detailed course maps are currently available for about 3,000 of the roughly 17,000 golf courses in the United States, with downloads costing a pricey $20 per map.

Purists note: The United States Golf Assn. bans GPS systems at sanctioned tournaments such as the U.S. Open and U.S. Amateur championship. It does allow rounds played with them to be included when calculating a handicap.

In my first round with a StarCaddy, I failed to get it to work right. The receiver did its satellite positioning thing but the software wouldn't paint the X to denote my location on the course map.

The X moves as you navigate the course. The distance to the center of the green is given to the nearest yard.

My StarCaddy debut at the Cranbury Golf Course in New Jersey was thus a washout.

To make matters worse, I was befuddled because it appeared I had the wrong map. So I gave up and left the PocketPC in the cart. A few holes later, I discovered the problem. The front and back nine were flipped, so holes 1 to 9 were numbered 10 to 18 and vice versa.

Still, the StarCaddy offers some cool features--even without the GPS. The ruler tool lets you draw lines on the map and get exact lengths. This is a big help when planning strategy on long holes. You can find out exactly how far a distant water hazard is, or gauge the best approach to a dogleg.

Since it was useful without the GPS, I allowed StarCaddy one mulligan and decided to try it again a few nights later--after talking to tech support and rebooting so the magical X actually appeared.

When I appeared at the course at 9 p.m., the kid closing up the cart shack was ready to give me the boot--until I showed him the StarCaddy. "That's phat!" he exclaimed, before allowing me to wander the course in the dark.

This turned out to be a fun way to test it out.

Getting a GPS connection is easier once you are familiar with the menus and troubleshooting tips in the user's guide.

In pitch-black darkness, I used the GPS to find the first pin with no problem, then navigated through a few other holes and back to the parking lot.

After my successful navigation, I reconsidered the StarCaddy: Is it worth the money? For me, one issue may tip the scales.

The folks at LinksPoint, which makes StarCaddy, say they hope to eventually set up wireless networks at finer clubs and resort courses. This means you could use the StarCaddy to order drinks or schedule a post-golf massage while still on the course.

The future surely looks bright.

Yes, they will work. When programming, hold down the "shift" key while typing the frequency (except the decimal point) and it will look like this: !$$.#())) Then when you hit enter it will show 144.39000 as your frequency. The only problem is that you are now outside the power set calibration limits, and you may have 70 watts out! Pinouts for the 16 pin connector are at http://home.teleport.com/~n3eg/maxtrac.htm for the Motorola dash mounts. Good luck!

Nothing would have helped that TREE installation. In fact, perhaps the insurance company may have had opportunity to deny the claim since the dish wasn't affixed to the house. And no doubt, in the tree they didn't run any ground conductor from the dish down... no adherence to NEC here... even then, with the tree potential at a million volts, that nice copper RG6 provides a nice pressure relief. Between the house wiring and the tree is the poor satellite receiver and TV. The results were obvious. There are some power bars that offer a F connector so that the RG6 can also be included. This is mandatory with the home entertainment system: To put all equipment on the same potential and let it float together. But I have taken apart some of these power bars and found normal PC board traces between the F connectors.. that is, not a proper 75 ohm transmission line. Seemed OK for below 500 MHz, but not at the dish downlead frequency!

One electrical contractor I know had a loose neutral on the home generator he installed for a customer. When the machine was started, unbalanced loads caused an over voltage condition in half the house. They quickly realized this and shut the generator down. Some things had to be replaced (light bulbs, electronics, etc), but there would have been much more damage if most electronics weren't plugged into cheap power bars. Their ONE little MOV caused melt downs to the power bar plastic casing, but protected the equipment!

>You can have two similar appliances on the same circuit
>or outlet and after a strike one will be visibly "smoked"
>and the other will work just fine.

And some will die days or weeks later. As a number of appliances did in my place 8 years ago when I took a close (across the street) hit. Some stuff fried right away, 1 phone, 1 stereo, 1 TV, and a computer. Other stuff like the electronic ignition in my hot water heater went a week later. Another computer keep giving me problems until it croaked after about 2 weeks. I lost remote control of my other TV, then the color went a couple days later. My alarm system went south too. One month after the strike, I had an insurance check for $7,000 to replace damaged appliances, and an additional $5000.00 for the damage to the

```
home from a couple large tree limbs that fell on the garage and wind
damage to the house.

This is common also with ESD failures.
You puncture the gate insulation (a few tens of nanometers of glass) and
later metal dendrites grow across it and short out the gate.  The atoms are
attracted by the potential difference, and strong field where the glass is
ruptured.

Hi Guys:
There is a lot of good info at www.PolyPhaser.com
Very good books on Lightning Protection as well.
Cheers - Fred - VE7FFK

Thanks Bob for your suggestion.  I learned something from your message.  I
was convinced that the TH-D7A only received messages addressed to that
particular tracker since I had never received a message on it that was
addressed to one of my other stations.  Now I understand why; because my
station that the message was addressed to would send the "ack" and stop the
process.  I just tried several messages  sent to a non existent SID with my
call sign and they all displayed just fine on my TH-D7A.  I only own the A
not the G.  My D700 always has managed to log all messages sent to any one
of my stations.  Of course it has a much better antenna than my D7A.

The other point is that if you see something amiss with a station, check
that stations status text before you respond.  My trackers generally will
give you the voice frequency of a repeater that I am monitoring at that time
and my D700 if left alone for a long time while I am in the backcountry will
give you my digital beeper's email address.  Yes, I can be reached by email
in most of the locations where I spend my fun time.  Sure love these high
tech toys.

Also Bob, next time you come through our area, please let us know in
advance.  Maybe we can establish an impromptu dinner with some of our group
and you at a restaurant convenient to you.  It was good seeing your call
sign on our local network last night.

Here are the technical specs that I promised everyone. The final order is pending a response from Dell. I do not have the shipping price as of this date. This will over a thousand dollars left over. Until I know the shipping, I do not know that total. The extra funds will be help for tapes for the tape backups and any repairs/upgrades once the server gets out of warranty. I did not post the specs on the cd rom, nic, modem, keyboard and mouse. The raid and tape drive are redundant to a certain extent. The reasoning was if the primay data drive dies for what ever reason, we just tell the Linux box to go to the new data disk and we install a replacement, no data lost (except for the down time). If the entire system craters, we will have backups on tape that we can rebuild the entire system from. Why 3 hard drives and a hardware raid? As per Steve's specs, the first drive is the OS (RH Linux 7.3 with all patches will be installed on it) and a second for the database. The third disk will be copying the database disk. The drives are SCSI, not IDE. SCSI will improve the disk access times. For those not deep in the computer and server market, that improves how fast the processors get the data and render the page. You might not see it on a 72 hour history but you will on a multiple week, month or full year basis.

In a post several weeks back I indicated we would purchase the server with a small amount of memory and upgrade it with local memory. Since the original cart we looked at expired, Dell dropped it's prices on memory to the point at there was not advantage to going with aftermarket memory. When we get the final numbers from Dell (shipping that is) and their target delivery, I will let everyone know. I promise many pictures will be posted when the box arrives.

On the connectivity issue, I found out this moring that instead of only having a 1.5 megabit DSL, the co-lo site the server will be at has 2 OC3 connections. This buries a 1.5 megabit dsl line.

SPECS:

PowerEdge 1400SC with Pentium III Processor: PowerEdge 1400SC, Intel®
Pentium III 1.13GHz w/512K Cache   14113SC

Additional Processors: 2nd Processor,1.13GHz/512K,P3

Memory: 1GB SDRAM, (2X512MB)

1st Hard Drive (All drives must match for RAID):   36GB 10K RPM Ultra 160 SCSI
Hard Drive

2nd Hard Drive (All drives must match for RAID):   36GB 10K RPM Ultra 160 SCSI
Hard Drive   36GB10

3rd Hard Drive (All drives must match for RAID):   36GB 10K RPM Ultra 160 SCSI
Hard Drive   36GB10

Hard Drive Configuration: Add-In Raid Card, Raid 5   AR5   [340-1955]

Tape Backup Unit: PV100T, Travan-5, 10GB, Internal TBU, IDE

Hardware Support Service: 3Yr BRONZE Support, Next Business Day Onsite

Uninterrupted Power Supplies: APC SmartUPS 700, 700VA   APC700B

Sub-total: $5,025.00 (does not include shipping).

Rendered body type: text/plain

What better this to have your cellphone as a tracker? I guess that several
US mobile operators are also reluctantly looking into this. I can already
see the privacy issues that need to be overcome for this to be an option
here or in Europe...

KDDI launches corporate LBS
30/07/2002
Japan's second largest mobile operator, KDDI, has launched the first 3G
mobile location based service.

Called GPS maps, the new service is aimed at the corporate sector and uses
the company's cdma2000 1x GPS Ketai system.

KDDI says its new 3G handsets are "GPS-enabled". The new corporate offering
allows company managers to keep track of all personnel or vehicles equipped
with the correct handsets. The system can also display recent location
movements for each user. According to KDDI the service is designed to assist
companies with transport management, sales and marketing activities and the
dispatch of maintenance personnel.

The Ketai system uses Global Positioning System satellites and wireless
routing stations to provide users with location information, which, KDDI
claims, is accurate to within a few metres.

It seems that First.aprs.net is having problems. You can connect, but it is not sending any data to most connected users.

http://first.aprs.net:14501 status page shows it has 274 inbound connections, but only the first few are getting any data. First is running javAPRSSrvr 1.b.406

The following users are shown by the status page to have 20+ connections each:
K4HG, port 23, javAPRSSrvr 1.b.409
findu, port 23, javAPRSSrvr 1.b.409,
findu3, port 23 javAPRSSrvr 1.b.409
Java (208.11.55.85), Port 10151, JavAPRS 2.3b02

Others with multiple connections include
NOCall, DK0TUX-3,JavaRoc and a few others.

Bill KC9XG

My vehicle location can be viewed at:

Rendered body type: text/plain

first experienced a problem yesterday morning that was seen by a number of javAPRSSrvr's. Fortunately, I trapped the problem on my server and immediately issued a fix that was sent out to all javAPRSSrvr users. Chuck must be out of pocket as he has not restarted first with the new build yet.

second and third are now operating fine. second did not experience the problem but has been upgraded to ensure its stability in the future.

  Maybe someone can make "rabbits"  who said that!   73, Jerry

Hmmmm.  Somebody else caught on!  It's been a joke between some of
my SAR buddies and myself that we might do an etch-a-sketch sort of
thing one of these times during an APRS demo, either by talking the
person through a bunch of turns, or by creating a drawing earlier
and using a Garmin route or trakback in simulator mode to emulate
the driving.

It might liven up the demo a bit.

846. [aprssig] IPRS, a marriage of IRLP and APRS?

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 30 Jul 2002 19:39:47 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

<aprsnews@lists.tapr.org>, Dale Heatherington <dale@wa4dsy.net>,
David Cameron <DCameron@transtechinteractive.com>
Message-ID: <LYR842-91979-2002.07.30-19.19.04--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
IPRS:                 IRLP<==>APRS                  26 July 2002
-----------------------------------------------------------------
                                                           WB4APR

IPRS is an acronym to describe the potential of a marriage between
the global APRS digital network and the global Internet Radio
Linking Project.  Combining the first and last letters of IRLP
with the final three letters of APRS yields IPRS!

As APRS grew to global proportions in the late 90's through the
internet connectivity pioneered by Steve Dimse (K4HG), I began
looking for ways to add internet voice connectivity to APRS and
called it AVRS.  Over the same period, Dave Cameron's (VE7LTD)
Internet Radio Linking Project has risen to prominance world wide
by providing that same kind of global conectivity as APRS but with
```

voice.

Taking advantage of the voice connectivity of IRLP, recently we have defined many ideas and APRS formats to be able to use APRS as an adjunct data link to facilitate the end-to-end signalling between end users of IRLP using APRS. Further the mobile APRS data displays make an excellent function for displaying IRLP network data to the mobile user. One of the ultimate objectives of the APRS adjunct to IRLP is the ability of an APRS mobile user to establish an end-to-end voice connection to any other amateur on the planet with no other knowledge than his callsign.

We can already send him a real-time APRS message, why not Voice?

Thus, the IRLP system and the APRS-IS (Internet System) could work together to make the end-to end voice connection using the nearest available IRLP nodes. At the Radio Amateurs of Canada (RAC) National convention in Vernon, BC on 26 July, I discussed this concept with Dave Cameron and suggested we might define this marriage as "IPRS". This "IPRS" term will facilitate further discussions about this revolutionary potential! THe following is 3 phased approach could be used to arrive at that ultimate objective. The first is MANUAL, the second is ASSISTED and the third is called AUTO-QSY.

MANUAL - APRS user-to-user Call-back message. (Works now today!)

ASSISTED - Central IPRS server watches global IRLP and APRS-IS system and when seeing IPRS-CQ, sends APRS-QSY msg to BOTH users informing them both of the nearest not-in-use IRLP node numbers and freqs. Users manually QSY and the caller establishes the IRLP link.

AUTO-QSY - End user's radio, on receipt of the APRS-QSY message, will AUTOMATICALLY QSY, and central IPRS server will automatically establish the IRLP node links! (HAM CELLULAR)

The following paragraphs elaborate on the above phases and add additional details to this concept. Also, by using the CQ-I call indicator to indicate the request for an IRLP link, provision can also be made for CQ-L for ILink, and CQ-E for eQSO links as needed.

MANUAL - APRS user sends simple message to another APRS user indicating his call-back IRLP number. APRS recepient initiates IRLP call back. This works, NOW, TODAY! The format of the APRS message is simply:

```
From: WB4APR      To: VE7LTD      Msg: CQI #1234
```

The meaning is that WB4APR is asking VE7LTD to call him back on his current IRLP node #1234. The APRS message reaches VE7LTD (live) no matter where he is on the planet via the APRS-IS assuming he is on the air. On receipt, and if VE7LTD is available, he will establish the call-back IRLP link.

ASSISTED - A distributed IPRS server system monitors both the IRLP active node status and also the global APRS-IS stream looking for IPRS-CQ messages. On detection, it compares the positions of the users and the nodes and identifies the nearest non-busy IRLP node numbers to each one. If one of the nearest nodes is connected to a CONFERENCE node, then both users are invited to join the conference in session. This reply message to both end users is tailored to fit on each one's APRS message screen.

APRS PC user: 67 character free field line
TH-D7 HT user: 45 char line arranged as 12,12,12,9
TMD700 user: 64 char line arranged as 22,22,21

EXAMPLES of the IPRS Messages sent to each user on the TH-D7 HT display:

WB4APR sends APRS msg to VE7LTD saying "CQI" requesting an IRLP voice link. IPRS distributed server responds with messages to to both users informing them of nearest nodes to each of them.

Message to WB4APR (originator)

```
+--------------+  +--------------+   Message confirms to sender that
| CQ to VE7LTD |  | Use   I#1212 |   the IPRS processor has seen the
| on IRLP 2323 |  |  146.995^PL  |   IPRS-CQ message and tells sender
+--------------+  +--------------+   of his nearest IRLP node.
```

Message to VE7LTD (called station)

```
   +--------------+  +--------------+   Message to recepient asks him
   | Call WB4APR  |  | Use   I#2323 |   to call the sender on his IRLP
   | on IRLP 1212 |  |  446.375^PL  |   number and suggests the closest
   +--------------+  +--------------+   node that he can use...
```

If either of the nearest nodes to either of the users is currently connected to a conference node, then both users are informed of that situation so they can join the conference. The following message would indicate that #2323 near the callee is on a conference node:

```
   Message to WB4APR (originator)
   +--------------+  +--------------+   Message confirms to sender that
   | VE7LTD bsy   |  | Use   I#1212 |   the IPRS processor has seen the
   | 2323 = C123  |  |  146.995^PL  |   IPRS-CQ message but tells sender
   +--------------+  +--------------+   his nearest IRLP node is busy
                                        but that it is currently con-
                                        nected to conference node #123

   Message to VE7LTD (called station)
   +--------------+  +--------------+   Message to recepient asks him
   | Meet WB4APR  |  | Use   I#2323 |   join the conference currently
   | on Conf  123 |  |  446.375^PL  |   in progress on his closest
   +--------------+  +--------------+   node that he can use...
```

This same message would be sent to the originator if his nearest node was the one that was currently connected to a conference.

AUTO-QSY - The ultimate IPRS implementation is when the end users radio can respond directly to an IPRS command to automatically QSY to a given link frequency. This can be done through newly manufactured radios or retrofitted to existing radios with a simple external pic-processor. The Pic processor watches for the QSY packet command on the serial port and then sends the appropriated radio-control codes to set up the call.

Of course end users may enable various levels of auto-QSY to maintain some level of control over their radio response to these external influences. QSY commands may come in as BULLETINS to all stations in an area or as commands directed to only your station. Such a menu might consist of the following. Each level is assumed to include the processing of lower levels

```
   OFF  - No QSY commands accepted.  Displayed but not prompted
   1    - No QSY action, but prompt for Directed Commands
   2    - No QSY action, but prompt for all QSY commands
   3    - Respond to only Emergency Directed QSY Commands.
   4    - Include Priority Directed and above QSY commands.
   5    - Include all Directed QSY commands.  Prompt for BLNS
   6    - Include all Directed QSY commands and Emergency Bulletins
   7    - Include all Directed QSY commands and Priority Bulletins
   8    - Auto-QSY to all
```

Since the Kenwood D7 and D700 packet data can be monitored on the serial port while in APRS mode, an external PIC processor can watch for QSY commands and then command the radio as indicated. Thus, this IPRS automated QSY idea is backwards compatible!

NOTE to ALL AUTHORS: The "IPRS" processor that watches for CQ-I end-to-end IPRS user messages (on the APRS-IS) and then sends messages to BOTH END USERS with a recommendation about the nearest IRLP node and frequency to each end user, can be written BY ANY 3rd PARTY. Its operation is stand-alone and does not need any special access to IRLP engines or APRS engines. In fact, it does all of its work as an autonomous 3rd party.. Its only doing APRS messaging...

It would only need to twiddle within the IRLP system architecture if we get to the fully automatic stage where it not only finds the best end-to-end node recommendation, but then needs to automatically initiate the IRLP connects itself..

In the mean time, someone with nothing else to do could just sit down and do it.. ;-)

Rendered body type: text/plain

Data Point on the 6" D7 dummy load antenna:

I set up an APRS test in my office with the D7 and rubber duck and the radio heard NOTHING all day (Nearest digi is 4 miles away).. I mean, nothing ever even opend squelch!

I replaced the antenna with a full size 19" whip on the HT and put it back in exactly the same spot and now I copy everything.

This means on the order of a 10 dB improvement... at least... going from below squelch level (lowest setting) to good copy...

I assume that I can run a D7 for a month on external power without frying the nicads? Tonight I was setting up something and noticed the battery was warm. Not hot, but warmer than I would have expected to want to leave it running for a month...

This is first time I hve used external power. and this thingy Im building will be in a box for a month and I dont want to burn up a good radio...

I don't run mine that way, so I haven't seen this.

If the battery is warm, it's either heated by the transmitter heatsink, or overcharging.

Check it for a while with TX off.

Alternately, measure the current into the battery, when everything's on but idle. If it's more than 2-3mA for NIMH batteries, I wouldn't advise it. NIMH's are very sensitive to long term overcharge, and the old C/10 rule for NICADs is a bad idea. C/300 is the rule for NIMH.

I measured a 3x improvement in range to the local repeater.

That antenna is truly the golden standard for helical dummy loads. :)

At the risk of being a nay-sayer, I think I have finally come to the point of "this is ridiculous" attitude toward APRS.

APRS IS not, CAN not, and SHOULD not be everything to everyone. The suggestion that we start adding voice is ludicrous and is something that while it is a "cool idea" is NOT the direction APRS needs to go.

We have enough problems with bandwidth already. Should we not be concentrating on just making APRS work fluidly before we start trying literally take over all of amateur radio?

Yes, OK.....that IS a little over-the-top but I really think that voice is best left to simplex and repeaters. After all, how many people (REALLY now!) can actually manipulate a computer and a microphone simultaneously while in motion?

We have too many issue within the CURRENT framework to iron out before we become demi-gods.

Please, Bob..... I've never publicly disagreed with you before but in this case I'm going to. So, whilst I'm on my chemo-induced soapbox, I might as well preach a little....to wit...

The days of backward compatibility are over and probably have been for QUITE some time. How many people REALLY are using XT's and AT's to run APRS any more? For THAT matter, how many APRS users are even using a DOS-based environment at all? Move on, support an older version that will always be compatible but leave it at that: support.

>From a personal standpoint, I spent MONTHS sitting at the computer with a DOS editor creating and parring down X,Y points to create maps for DOS-based APRS. It was certainly a labor of love because in spite of asking those who downloaded and used the maps to send a $5.00 registration fee, I never received DIME ONE. This really is NOT the issue, but it IS part of the reason I quit doing DOS maps, besides the fact that the good-old 5000 point limit on the size of map files has NEVER been addressed because you can't go beyond whatever the magic number is that makes Q-BASIC puke.

Point being: there's just no point in continuing to support a platform which , arguably, a VERY small percentage of people are even still using (the hardware, NOT the software!).

Next, it's time to get off our collective tuck-i (that's plural for a

Yiddish word for hips) and start pressing for higher speeds. 1200 baud is what is holding us back. Until we can at least upgrade to an early 1990's data rate like 9600, all the fluff and "cool ideas" should not even be seriously considered until we, as amateurs begin to act as innovators rather than settling for a technology that the REST of the world left in the dust TWENTY YEARS AGO!.

OK, my head hurts now.... Peace and long life....

IF I understood Bob correctly, he was talking about using the APRS net to provide tuning information to a second radio, which would talk to the local IRLP repeater, if any.

Oddly similar to what I've proposed several times for high speed APRS nets on 440, where the local nets could be on any frequency, and the national net would carry advisory packets stating the frequency, and center location of the local high speed nets. The client would figure which is closest, and tune in, using the next closest if the primary is full, down, or otherwise unusable. Since nobody makes a suitable radio though, it's not very workable.. :(

I didn't get that he was planning to digitize the voice and send it over APRS, which would be unworkable due to low bandwidth and high latency.

853. [aprssig] ISS Pass

From: Mark Fellhauer <sparkfel@qwest.net>
Date: Tue, 30 Jul 2002 21:04:36 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-92002-2002.07.30-21.44.02--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Just for grins I fired up soundcard AGWPE and UI-View for the last ISS pass (Max 37 degrees above horizon).

Signal was quite strong on 145.800 MHz (or thereabouts)

Stations Copied from Sioux Falls

W9ORW - 514 miles (Valpo, IN)

AD5ER-3 - 653 miles (Amarillo, TX)

W5MBM-4 - 732 miles (Dallas, TX)

W3AFE - 1052 miles (D.C. Area)

K2RQA - 1164 miles (Albany, NY)

K1KWP-4 - 1268 Miles (Worcester, MA)

Equipment Used:

SatTrack/CE on Casio Pocket PC (AOS info only works on registered versions)
Uniden Bearcat BC895XLT Scanner

Radio Shack Discone Antenna (20 feet AGL) w/about 50 feet of cheap coax
Homebrew Computer with AMD K62-400 processor & CT4760 SoundBlaster
soundcard (OS is Win98)

If I can copy ISS packet with a Bearcat scanner, anyone with an HT should be able to do as good. I have a low-noise RF pre-amp on the way. It'll be interesting to see if that helps copy more stations (or just amplifies the intermod around here).

That's about the same setup I used to copy SSTV from the Mir station -- a Bearcat 870 with a 19" whip, with the Bearcat's tape record output fed into a PC running WinPix32. I had two cavities tuned to 145.9 between the antenna and the Bearcat to keep it from being totally wiped out on our RF-saturated hilltop....

I understand it as a means to notify another party that you want to talk to them, almost like a pager (can you make a D7A beep?). On top of that the system will figure out the closest available IRLP repeaters that could facilitate that conversation. The involved parties positions are known via APRS and the closest IRLP nodes can be determined by the IRLP database.

I think this is a brilliant idea. APRS does the messaging and positioning, IRLP will carry the voice traffic....

It's interesting..
I wonder how well it will stand up to use though, since it will undoubtedly put a lot of users on a few repeaters.

I'd like to give it a try though.

The idea is not to use APRS frequenices for voice, but to have a system that manually or automatically changes to an IRLP frequency.

Have you looked at the new Yaesu radios? The VX-7R & FT-8900 have an Internet button on them. This is for WIREs (Wide-coverage Internet-linked REpeater) access.

Yaesu has the PDF manual and brochure for the VX-7R
online. NOTE: although this info is in English, they used some Japanese
fonts, so for best results, download and install Japanese language support
to your Adobe reader (about 5 MB to download).

I, and several others, have pointed out the problems with going to 9600
baud AX.25, including reduced robustness and reduced range.   It is not a
panacea for the issues that have manifested themselves in the APRS
network.   We need to leapfrog technologies here, not catch up with 1987.

I have problems with IRLP, it's a great concept, but I don't feel the
software interface is being implemented well.   Nor do I agree with the
removal of non-RF linking. If they actually think that everybody with an
HT is licensed, well, they've never been to Southern California...

Hey Mark (and everybody else!)

I think that the concept for IPRS is terrific, but I have to agree that we
need to increase speed by leapfrogging as you (Mark) say.

>I, and several others, have pointed out the problems with going to 9600
baud AX.25, including reduced robustness and reduced range.   It is not a
panacea for the issues that have manifested themselves in the APRS
network.   We need to leapfrog technologies here, not catch up with 1987.

>I have problems with IRLP, it's a great concept, but I don't feel the
software interface is being implemented well.   Nor do I agree with the
removal of non-RF linking. If they actually think that everybody with an
HT is licensed, well, they've never been to Southern California...

Have you looked at I-Link/EchoLink? I think the EchoLink interface for the
I-Link server system is very good, and would benefit from something like
this IPRS approach. As to the HTs all being licensed, all you have to do to
disprove is go to most any major metropolitan area to disprove that to
yourself! Too bad there's not enough ARDFers out there to track them all
down...

Anyway, keep the brainstorming guys! I think this is a great idea if we can
only hash out how to implement it. Bob, don't let your friends and mine at
DOD get wind of it. They'll just hire somebody to impement it in our
systems and charge $70K per HT to make it not work... LOL

Warning, here are some more of those dangerous ideas...

What if we combined IPRS with APRStt (APRS Touch Tone)?

This would allow a roaming user without a computer, TNC or an APRS enabled
radio to check into a local IRLP node to accept incoming calls or to request a
QSO with another station that has checked in with their local IRLP node.

Think of the possibilities...

860. [aprssig] Last ISS Pass

From: Mark Fellhauer <sparkfel@qwest.net>
Date: Tue, 30 Jul 2002 22:48:51 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-92022-2002.07.30-23.28.39--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I netted these stations on the last pass:

N9IDH - 431 miles (Milwaukee, WI)

W2CO - 489 miles (Longmont, CO)

VE3TZS - 833 miles (Collingwood, Ontario)

I snagged the VE call when the satellite was about 15 degrees above the
horizon and going down. That's way up on Lake Huron on the Nottawasga
Bay. A very nice place to be APRSing in the summer. Wish I were there... :)

I guess the reason I'm posting this information is it's a good way to
introduce someone to APRS, without having to spend a lot of money. With
just a scanner, external antenna, and a PII class computer with a
soundcard, you can copy satellite/ISS traffic. I actually think soundcard
AGWPE is more sensitive than most of the hardware TNC's I've owned.

IRLP is a service running on a Linux server and not a desktop application. As such I think the interface is quite adequate.

If you think about unlicensed users on IRLP, the only way to access the IRLP system is via a repeater. I would hope reasonable care is taken to only have licensed amateurs join the IRLP repeater system. From a user point of view there is not much of a difference between an IRLP linking and an RF linking. There is no way of ensuring only licensed amateurs use (or abuse) a linked repeater, be it RF or IRLP. What you CANNOT do is simply fire up a computer, download IRLP, plug in a headset and talk away on IRLP linked repeaters. The IRLP system is only accessible via participating RF repeaters.

OT - maybe not if I scan a map or 2

At any rate, it seems that the wall wort/ power supply for my scanner has been lost??? Does anybody know what the power requirements & polarity is for a UMAX ASTRA 1220p scanner? May I can get one at RS. I found nothing on the UMAX site, so maybe someone has one and can let me know?

thanks,
Doug/KC7IMR

Hello Bob/Robbie:

I have run HTs in the past, SOLELY from a power supply.
*While in Japan, and also in Southern California) My Tokyo packet

```
station consisted of an IC-W21T (Japanese model) wired through
a 30W 2m amp (RARELY used).   The set up worked FLAWLESSLY.
I operated through a BBS (7J1YAB) a good 20 + miles away on and
managed to get connected without any problem  (QRM sometimes).
The radios ALWAYS worked just FINE, and I USUALLY
ran them at FULL power, not low (5W).
You can typically expect it to run about 6 or 7W out
off the power supply.
I think it'll do just fine.
Will there be a trickle/float charger attached?
(just curious)
I am presently testing a large capacity, deep cycle
battery I acquired, and it is being simultaneously
charged by a 600ma float charger.....
I'll let you know how it turns out.
I'm presently running it on the local BBS
frequency, but will switch it to APRS shortly.
I'm running a test to see how long it will operate
with the float hooked up, and running the tnc (MFJ-1270C)
with a FT-2600M set on 10W output, with a beacon every
9 minutes.
Next I'll run a GATE test HF/VHF on a weekend, to see how
long the pair (an IC-706MKIIG) will run, with a PK-900.
It's HURRICANE season; don't 'ya know ?

I wonder if all the talk of IRLP as brought www.irlp.net to it's knees.   I
have been unable to access that URL for several hours now.

Woops; Missed That Part:

Why would you leave the Ni-Cads IN the radio if
you are operating it from a power supply ?
Nope; I wouldn't do THAT....either remove them,
or place something in the battery compartment to
keep them from being continually charged
(electrical tape?; too messy when it heats up.
paper?; bad idea....take 'em out).
Can you DO that in a D-7?; I'll go look @
the manual on Adobe.

It leaves the battery contacts exposed, and I'm not sure the ext power
interface will support full power output.

Just another abysmal "charger" implementation..
Why can't I ever get away with that in a commercial product?
:)

When I ran my D7 in the truck off the acc port, I used the alkaline battery
pack without batteries. That way I still protected the back of the radio and
didn't need to worry about overcharging.

Thank you all for allowing me to start yet another interesting and (as yet) non-violent debate/conversation! Always good to know that I've still got it!

Another thought: Why does this have to even deal with APRS at all? It doesn't seem to be dependent upon APRS software at all but simply relying on the radio to know it's location (a simple connection of a GPS) and the interception of a broadcast bulletin from the local IRLP node, right?

This entire application wouldn't even have to be on the primary APRS frequency and, as such, presents another heretofore (ya, I get to use those $0.50 words now that I've finally finished my Masters!) unmentioned "evil word". ANOTHER APRS FREQUENCY.....

WooooooooooOOOOOOOOOOOOOOOOOOooooooooooooooo!!!!! Am I gonna git it NOW, er what, Emma?

<evil, sadistic laughter>

Data Point on the 6" D7 dummy load antenna:

I set up an APRS test in my office with the D7 and rubber duck and the radio heard NOTHING all day (Nearest digi is 4 miles away).. I mean, nothing ever even opend squelch!

I replaced the antenna with a full size 19" whip on the HT and put it back in exactly the same spot and now I copy everything.

This means on the order of a 10 dB improvement... at least... going from below squelch level (lowest setting) to good copy...

The VOICE remains where it is, on IRLP, ILINK, ECHOLINK, or whatever.
IPRS is simply a way of sending a short APRS message to someone saying I
wanna talk... now...  and letting the power of APRS figure it out for him.
Total load on APRS is one message.  ANd if it helps them establish a VOICE
qso on another channel, then it will actually reduce loading on APRS
because they can handle a LOT more throughpout by talking than trying to
send multiple one-liners to get the traffic through.

> world left in the dust TWENTY YEARS AGO!.

For a single packet every now and then to arrive error free in a mobile environment over a range of X, that will ALWAYS be done better and more reliable at 1200 baud. And if we get people to cut back on their path length to 2 or 3 hops max, we can still support a LOT of growth.

I agree 100% that we need high speed backbones, but just dont want people to think that switching to 9600 baud at the mobile really gains anything... It doesnt. Its worse...

Bob and SIG,

I have noticed that several people have made reference to an alkaline battery shell. One option may be to build a D/C interface into the shell (may need to buy a new one but they are usually cheap). I did this with an Icom IC-T2H sport that does not run from 13.8 volts according to manual the jack on the radio is not supposed to be used for operations. I just whipped out the old dremel tool and removed the separators and wired some 6 amp diodes and mounted a powerpole on the back. and power level setting.

I can now run the radio from any ~13.8 D/C source, I also don't need to worry about the little coaxial power connectors falling out as the shell snaps on the powerpoles are a better connection. I normally use a 1.2ah or 7ah gell cell in a beltpack. It works great and gives me1or 6 watt output for hours or days depending on the pack. It is easy to vary the number of diodes to get any voltage needed. Yes I know it's not the optimum solution but it is cheap, rugged and easy. You can also add a cap across the terminals to absorb some of the spikes from car noise.

The way I see it, its just like the CELLULAR concept. That as the load incereases, the CELLS get smaller. The time is soon gone that a WIDE area club VOICE repeater with 500 members should be supporting an IRLP node for these kinds of directed one-on-one calls...

Many IRLP nodes in the future will have HAAT's of less than 100 feet and
only reach out 8 miles to a mobile... This allows for multiple re-use of
the frequencies... Each one operates on SIMPLEX for spectrum efficiency.

This is not to say that there cannot still be WIDE area IRLP noddes at
all, but with APRS konwing where everyone is, it simply means that we can
go to 99,000 small nodes without worrying about how to keep the list up to
date. We dont. the IPRS processor always makes the conncetion
mostly based on POSITION, and probably only uses links to non-busy node
sites.

In fact, I think it will evolve a new IRLP/ECHO-LINK node class. One that
is NOT intended as a general purpose wide area REPEATER chat coverage, but
one that is intended as a local node to establish and end-to-end
one-user-to-one user connection... a HAMCELL phone call if you will...

In fact, my HOME station would probably be switched into that service when
I leave the house. This would let me receive IPRS calls in my mobile
during the first 15 minutes of my commute. And then the NODE at my office
would pick me up during the last 15 minutes of my commute...

In fact, why dont we call these things IPRS nodes...?
(And this has nothing to do with APRS other than supporting the
message to initiate the call)...

Hmmm

Why not at the same time - extend the concept for data networking in
general.

I.E. ability to do the same for SEDAN or NOS or "whatever" data connectivity
that might be in the area... ultimately, 144.39 could just end up being a
control channel (a la cellular infrastructure control channel) for lots of
amateur radio functions...

Here's the opportunity to revive a previous concept that was mentioned here
in the past...

As you travel around... (and you enable the mode)... your rig can receive a
list of the local repeaters - that (with your approval) you can select for
use...

No more having to pull off the road... check your repeater directory... tune
your rig... call on a few repeaters for local info... just go through the
memories that have been reprogrammed with the data...

Eyes stay on the road...

On the data side... maybe DAMA will come to the US !!!!! yippeeeee

This would require a central database with accurate repeater information.
Is anything like this in existance?

Adi

Actually, since we have a growing number of IRLP type systems providing end-to-end HAM voice connectivity, an "IPRS" system would need to be comaptible with them all. In other words, we need these systems to tell US their active node status, not having to re-invent a new interface to each new IRLP clone that comes along.

The answer is to have each NODE of any voice system report its instantatenous status on APRS with a conventional LOCAL packet as we began suggesting months ago. This single one-line packet contains EVERYTHING necessary for any IPRS process. That is, it contains POSITION, STATUS, FREQS, PL and FCC call. For example:

```
 ;MDannap.*3859.11N/07629.11W&IRLP#12345 on 147.555 PL156

Where: ;...*...   is the standard APRS object format
       MDannap    is the 8 char node name (Human readable, Annapolis MD)
       .          The "." means IDLE. "=" is connected. "?" is down etc
       LAT/LONG   is the position..
       IRLP#12345 identifies the node
       147.555    is the frequency and PL
```

This packet is from IRLP node number 12345 and has the geographical IPRS node name of MDAnnap indicating it is in Annapolis MD. (All IPRS nodes need an 8 byte human readable name for ease of human reference). This assures that we can display the node status on the front panel of the APRS mobile and HT displays. See my IPRS web page for how it looks... Remember, the radio also computes your distance and directon to the node!

Any IPRS engine watching the global APRS feed will see the current status. Other systems will have similar identifiers such as:

```
  I##### are IRLP nodes
  L##### are I-Link nodes
  E##### are Echo-Link nodes
  Q##### are eQSO nodes
  etc
```

Of course the existing numbering plans are internal to each respective system, and these first letter TYPE groupings are only for external IPRS discrimination. Generally, IPRS (APRS) only cares about the LAT/LONG of the node. That is what it uses for link determination...

Controversally (KU0G's concerns), I think these nodes should simply send their PACKET status on RF direct, no hops on 144.39. Advantages:

1) Instantaneous status avaialble to local mobiles.
2) Mobiles can display NODE status on the front panels
3) Status also available to the APRS-IS system
4) Its a universal interface (IRLP never needs to be concerned about how or where or why this gets into APRS...
5) APRS can take data and use it in creative ways independent of the differing types of nodes sending it (IRLP, ILINK, ELINK, etc)

This does NOT add any significant load to the APRS network at all. It adds ONE local packet on each change in status of the LOCAL IPRS voice node. No Big deal... Remember, APRS was designed for LOCAL use. It was NOT designed for the 24/7 monitoring of tens of thousands of square miles of activity across 5 states on a totally saturated channel... Its like cellular. Use the cell locally, and put on it what the locals IN SIMPLEX RANGE need.

Use the APRS internet if you want to see into another state...

Here is the IPRS WEB page   http://www.ew.usna.edu/~bruninga/iprs.html

I imagine somewhere in the bowels of the ARRL, the ARRL repeater directory
has a database dedicated to it. Now getting access to it might be a different
story.

Not at all. It is LIVE data. We do it in our area. Repeaters that are useful to support local APRS activities have an OBJECT packet implanted in the local DIGI that sends it out every now and then... Thus on the front panel of yoru Kenwood, you see when you are in range of a repeater and its frequency. In fact the name of the obnject is its frequency, thus on the radio you see:

    146.76 as the callsign...

And on your attached GPS display you see

"INVALID WAYPOINT NAME RECEIVED"
"Hit ENTER to continue"

So probably better to use REPEATER freqs as node names without the decimal point and make them 6 digits as in 146760

Again, we do NOT want to see every ego repeater showing up on APRS. But we do want to send out to mobile visitors the frequency and location on their maps of the "best" repeater in an area for them to find someone to chat about APRS...

Oh, and of course, an up-to-date database then is as simple as monitoring the APRS-IS for a few minutes... ANd of course, we tried building such a data base into APRSdos. Just hit MAPS-OVERLAY-VOICE and if anyone had submitted your area repeater, it whould be overlayed on your mobile map... (but there was not much response, so I just add repeaters when I am driving in an area and someone tells me about their favoriate local repeater...)

But the ONLINE method is the way to go, then APRS can SENSE them without a data base. Please use the /r ICON for consistency...

OK, knowing this I have a question.

I have tried to interface Bobs APRSTK in Brents APRS+SA so I inject packets
from ISS and PCSAT into the data stream. I am connected to "second". Is
there a lookup using the "q" construct that would show all packets that
I-gated through WB0WNX?

No, but it is one of the things I am planning to add to findU. This would take a redesign of the database, I would need to add an IGate field to the raw table and parse the IGate out. Of course, any time one adds a field to a table, the database must be offline. Therefore I won't be doing it at least until the new server is online and functional. (Or if the database crashes and needs to be rebuilt, which has only happened three times, twice for power failures greater than the 40 minutes the UPS can support, and once when the system drive crashed...I have used these opportunities to add fields before.)

If I may take a moment to to give my original vision of this construct...

When I was actively administering the APRS IS, I spenT an inordinate amount of time checking for misconfigurations and tracking down errors. At the end, I was spending 20 hours or more a week on this, and the APRS IS has grown since then. I've often stated that not including trace data in the APRS IS was the biggest error I made in its early planning stages.

I hoped that this q construct would do this, and indeed as originally discussed between Dale, Bob, Bill, and myself this was the plan, but Dale and Pete have chosen not to implement it because of concerns that the bandwidth use would be excessive (though with aliases like 1 for first, the increase would be 5-6%). The benefits would have been an absolute loop prevention method, automated stream monitoring, and automatic APRS IS mapping.

It looks like these dreams are dead, (the TAPR dictum I love to espouse "he who codes, rules" finally came back to bite me ;-) but at least some interesting things will be possible, for instance I should be able to assemble a map of the furthest heard packets from each IGate, though this will need to be done offline rather than as a cgi because of the time involved.

1. Tx a posit.

2. Copy the posit you tx'd from the UI-View Terminal window. (Drag mouse
to mark text then Ctrl+C, or drag mouse to mark text then right-click
marked text and select Copy.)

3. Paste it into a message to this list.

It should then be easy for someone to tell you what is going wrong.

I am pleased to report success interfacing Bob's APRSTK and Brent's APRS+SA
so I am now an Igate for ISS and PCSAT.

The Problem:
APRS+SA only allows the program to use one serial port for TNC input. My

MFJ1270B was that serial port. The second serial input is reserved for GPS/Weather etc... I was going to use WINAPRS since it allows two TNC inputs but recent reports indicate the program still has unhandled exceptions. Since I travel for 3-4 days at a time and would not be around to reset the system as needed this was unacceptable.

The Solution:
I wrote Brent and asked him to consider allowing a second TNC on port 2 of APRS+SA. He suggested using KIPSS for the existing TNC and feeding the D7A(G) run by APRSTK to the APRS+SA serial port. KIPSS is provided with APRS+SA and, while it was lacking some documentation, I did get it running (thanks to the SIG) after a few false starts. KIPSS creates a TCP/IP stack connected to the TNC. Any computer on the network can connect to this stack. In my case I only use the one computer running APRS+SA but as far as the program was concerned I was no longer using a serial port. I then split the output of the D7A(G) from the DOS machine running APRSTK and fed just the data out from the radio into the serial input of APRS+SA.

The Results:
Below is a sample of the TNC page from APRS+SA

```
TASCO Radio Modem
AX.25 Level 2 Version 2.0
Release 08/18/98 2Chip ver 1.00
Checksum $F0
MY NOCALL
MYCALL   was NOCALL
PORTO $0000
PORTOUT  was $0000
K:N0ZQR-2>T2QT1X,N0ZQR*,WIDE,WIDE/1:'¦W'l#1v/]"8m}
K:N0ZQR>APRS,WIDE/1:=4213.91NN09701.19W# N0ZQR Ron, Wayne,NE
WB4PGT-2>SWUS0V,RS0ISS*,SGATE,WIDE:'g>□l □[/>
KG4QMI-1>APRS,RS0ISS*:=3610.76N/07628.39W-73 de Ed in Hertford NC/FM-16/QSL
via edwardl@inteliport.com {UISS21}
K:N0VLX-2>T2PQ6Q,N0XBN*,WIDE3-2/1:'}4Wl#V>/]"9+}fred, Norfolk NE

Rendered body type: text/plain

Hello,
I am having a problem with APRSd and I am wondering if anyone else
running it has the same problem.
The version is latest CVS version.

The problem is that when anything is transmitted from APRS IS to RF I
get two extra lines transmitted with it.

For example a packet will go out with the path we use of WIDE,WIDE2-2
and then I will get two lines of path information, but just blank lines.

Almost as though two extra carriage returns are being dropped in
somewhere.

Anyone else see this on their local APRSd or can look at the code and
take a guess why??

Thanks,
Mike Wolthuis

Next time try it without RELAY.
The problem may be caused by a station running the alias of RELAY.

Some of the cheaper suggestions I have gotten would be great for the EOC.
The only reason I'm not going that route, is because I specifically
something that interfaces to a computer. I probably should have mentioned
that in my first e-mail. That's why I am looking at the Boltek, because it
interfaces to the computer, and looks to have some nice displaying software,
with lots of features.

Both Spain and Portugal recognize CEPT licenses (called after the CEPT
agreement that allowed inter-country operation for HAM radio in many
European countries). Canada and the USA are also affiliated with CEPT,
so operation while you are on vacation should not be a problem. Although
I haven't been in EA/CT for a while, I am pretty much sure that they are
on 144.800, the pan-European APRS frequency.

As for documentation you should take with you, I'm not sure what you
have, but some kind of paper showing whether you are CEPT class I or II
should be good enough. If you don't have that, I'd just take a copy of
my HAM license. The only time I have ever been asked for my license was
when checking in at a local airport with several handhelds, battery
packs, and HAM rig in my hand luggage. Since then, I have traveled
```

extensively to Europe with all kind of HAM radio and GPS equipment in my hand luggage, and all security has ever been interested in is checking my laptop for drugs and explosive traces.

Some other 2-meter info for Europe in general:
Just be mindful that the 2-m band in Europe only stretches from 144.000-146.000, and that generally, for FM-based operations, a 25 kHz or a 12.5 kHz channel raster is used. For voice operations, most repeaters are between 144.600 and 144.7875 (output) and use a -600 kHz shift. Many also need a 1750 Hz "beep" to be opened, and once open they can be used without PL tones. If you have a US-style handheld, there is often a way to switch to the 12.5 kHz step mode, and you can practice whistling the 1750 Hz tone (which works reasonable well).

Have fun over there!

The boltek units do work. How, is a question for Bob Boll, bt they do work, with a single sensor. They track the storms within reasonable accuracy.

The simple pulse detector units give no indication of direction or range, just a pulse for each detected stroke, which varies with antenna, mounting height, and the exact schematic, making them somewhat useless. Is that a large stroke 50 miles away, or a small one a mile away?

Set to 145.825 via W3ADO-1 every afternoon and we whould see you via
PCsat... Oh, depends on when you are traveling. The 4 hour window with 3
passes in it moves earlier about 20 minutes every day... so check before
you leave...

Apparently he's running UI-View32 V1.75. Does this version not have a decaying algorithm for bulletins? Perhaps s/he also needs to upgrade to v1.8.

>From the specs, page 73:
<quote>
General bulletins are generally transmitted a few times an hour for a few
hours, and typically contain time sensitive information (such as weather status).
</quote>

His use of a bulletin to announce the band opening seems appropriate to me.

At 06:06 AM 10/1/02 -0500, Steve Slay wrote:
>Next time try it without RELAY.
>The problem may be caused by a station running the alias of RELAY.

RELAY is the standard first digipeater for mobiles.   If there's a problem with a RELAY station, which is very unlikely since it's the simplest digipeat mode there is, we need to track down and fix it.

Visiting the raw data at Findu -

http://www.findu.com/cgi-bin/rawposit.cgi?call=kb7ado-9&start=24&length=24

We get Bob's original packets:

```
-----
KB7ADO-9>APP120,N7QXO-9*,WIDE3-2,qAS,WA7NWP-3:@301935z4543.55N/12239.30W>350/053//A=000213pocketAPRS
v1.20
* KB7ADO-9>APP120,N7QXO-9*,WIDE3-2,qAS,WA7NWP-3:@301937z4545.56N/12239.92W>347/060//A=000322pocketAPRS
v1.20
KB7ADO-9>APP120,RELAY*,WIDE3,qAS,WA7NWP-3:@301938z4546.43N/12240.19W>347/052//A=000292pocketAPRS v1.20
* KB7ADO-9>APP120,N7QXO-9*,WIDE3-2,qAS,WA7NWP-3:@301940z4548.24N/12240.82W>342/056//A=000266pocketAPRS
v1.20
KB7ADO-9>APP120,N7QXO-9*,WIDE3,qAS,WA7NWP-3:@301941z4549.14N/12241.23W>342/058//A=000299pocketAPRS v1.20

-----
```

Then from the end of the display, the two bogus packets show up at the end:

```
-----
KB7ADO-9>APP120,RELAY*,WIDE3-1,qAS,WA7NWP-3:@302038z4608.65N/12253.92W>062/024//A=000052pocketAPRS v1.20

KB7ADO-9>APP120,RELAY*,WIDE3,qAS,WA7NWP-3:@302040z4608.76N/12253.06W>054/024//A=000059pocketAPRS v1.20
  * KB7ADO-9>APP120,RELAY*,WIDE3,qAS,WA7NWP-3:@301937z4545.56N/12239.92W>347/060//A=000322pocketAPRS
v1.20
  * KB7ADO-9>APP120,RELAY*,WIDE3,qAS,WA7NWP-3:@301940z4548.24N/12240.82W>342/056//A=000266pocketAPRS
v1.20
-----
```

Oh oh - looks like my APRD system, WA7NWP-3, is involved.   Digging a little deeper, by checking my archive of timestamped packets received on RF, I find the following packets I've received on RF from Bob.

```
---
0930204214 KB7ADO-9>APP120,RELAY*,WIDE3:@302038z4608.65N/12253.92W>062/024//A=00
```

The bottom two packets were received at 9/30/02 22:32:46 and 22:33:19 They really did come in "over the air" almost 3 hours after being first sent.

Questions for Bob/KB7ADO. Is this using a KPC-3 in the mobile? Were both the Palm computer and KPC turned off long before these packets were sent?

The best idea I have is that these packets might be buffered up in some of the KPC-3's four buffers and sent out later.

73,
Bill - WA7NWP

Great work, Bill! This is a great example of how APRS-IS and, more specifically, the server and IGate sysops can provide invaluable troubleshooting expertise.

Hope that you find the source of the "old" packets.

73,

Pete Loveall AE5PL

Yes, I am using a KPC-3+ with 8.3 firmware together with the Palm III and a GPS III+. Everything was off for close to 3 hours when the mysterious packets came over the air.

Long before Storm Scope, we used to use the old Radar Warning Receiver to plot angle to storms, worked great back when it was a direct reading CRT display. Don't remember if it used relative amplitude or time of arrival, but it had four antenas so could be either.

Rendered body type: text/plain

PCsat QST: Please turn off all unattended nightime transmissions.

Having left full sun on Sunday, PCsat is still fully operational without reset and today is passing through 25 minute eclipses on every orbit.

Although I reported a RESET last night during heavy loading over Europe in the dark, one of the many command stations around the world caught it in time and restored it before we lost too much energy. As long as we never let it go a full orbit with a RESET condition, we may be able to keep her in positive power budget for a while...

We are leaving the user digipeater ON because that is what it is up there for, but I would ask that users go easy on her in the dark and please turn off ALL unattended beacons after dark and before sunrise!

Lets see if we can keep her alive a while longer. Would love to make it to full sun again in November...

Normal operations in sunshine are OK...

19. [aprssig] NOSaprs 1.15b (BETA) - Now gates POS/STAT from APRS IS to RF

From: Maiko Langelaar <maiko@langelaar.net>
Date: Tue, 1 Oct 2002 19:22:20 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-101340-2002.10.01-22.04.17--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Greetings,

I'm pleased to release a patch of my Beta release 1.15b for
the NOSaprs software. Anyone running release 1.12.1 or higher
can use this patch. Enhancements are summarized below :

1) NOSaprs can now gate Position and/or Status information from
   the APRS Internet System (IS) to RF. Gating is controlled by
   two callsign or callsign pattern lists, which let the sysop
   control FROM which callsigns or callsign patterns, Position
   and/or Status information is to be gated to the RF side.

2) The APRS Message Center is alot more user friendly in the
   sense that it gives the client a better idea as to whether
   the intended recipient is there (on frequency) or not.

3) A few *bug* fixes.

What is NOSaprs ? In short, it's an APRS Server/Igate bolt-on
to JNOS and TNOS systems, allowing the sysops of those systems
to support their local APRS users, using their existing radios
and other infrastructure, without the need to setup separate
boxes or radios, etc. Complete information can be found at
the website below ...

For the 1.15b update kit (patch), plus more detailed upgrade notes
about the new features above, as well as documentation, and other
stuff, please visit my NOSaprs website at the URL below :

   http://www.qsl.net/ve4klm/packet/aprss.html

Got questions or ideas ? Need help ? Feel free to give me a shout.

Best regards,

Maiko Langelaar / VE4KLM

> simplest digipeat mode there is, we need to track down and fix it.

Do not discount the ramifications of the simple things when they are not
working correctly.
Especially when it is a simple thing to try running the TNC without RELAY in
the unproto path to see if different results are achieved.

I have seen the results of a KPC3+ TNC with the wrong setting for the
squelch ( I do not have one so I don't know exactly what the command is).
It has to do with setting the TNC to use the radio's squelch circuit and
then running the radio un-squelched or something like that.
In other words, the TNC is not set for DCD.

Anyway, the TNC buffers outgoing packets while it waits for a quiet time on
the air.
When the TNC finally hears  a quiet time on the air it DUMPS it's buffer.
This DUMP can last for a couple of minutes.

This could be the source of old packets.
If there is a station with this type of configuration error, and it has an
alias of RELAY it could very well be the culprit.

So..... TRY your TNC without RELAY in the unproto path and see what happens.
Then go from there.
Just a suggestion.

A lot of people think Doppler Radar is a newfangled invention that the NWS added to the general technical repertoire a decade or two ago, but if you look back to the original radar patents of 1917 or so, R.A. Watson-Watt of England was using it originally to locate meterological disturbances (storms) back then. I think he stole the idea from some Italians who were doing it a few years before him, but didn't bother to patent the idea. I think it was Watson-Watt who also discovered/verified the ionosphere (with radar)...or at least gets credit for it.

A few of the storm chasers around these parts are putting marine radar on their chase vehicles. I dunno if the FCC approves of that or not...it seems to depend on who you talk to.

Goodrich Aviation is now the pipeline for the Stormscope. It used to be 3M.

http://www.goodrichavionics.com/docs/weather.html

A description of the National Lightning Detection Network.

http://www.lightningstorm.com/ls2/discover/nldn/index.jsp

They also sell a real-time lightning tracking internet subscription for just under $400 a year. Ouch. It looks like they steal (err...borrow?) MapQwest maps.

They also sell lightning direction/detection hardware. No prices listed. If you have to ask you can't afford it...

25. [aprssig] Power for a Temporary Mobile APRS Station

From: Ralph Milnes <milnes1@rcn.com>
Date: Wed, 02 Oct 2002 12:30:56 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-101382-2002.10.02-12.12.45--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I need to get power to a temporary APRS tracker (5 hours) that I want to put in a car I don't normally use.

I want to use a mobile rig -- 50 watts out -- for best possible coverage. The cigarette lighter won't let me do that, so I'm thinking of bringing a gel cell battery.

But I'm wondering about the pluses and minuses (mostly safety issues) of attaching a temporary power cable -- fused, of course -- to the vehicles's battery and running it out the back of the hood and into the passenger window. Easy hook up is an objective. Would clip leads work, or is that asking for trouble?

73,

Ralph KC2RLM

I don't know why, that's only about 8A.

I agree with Dave on this. At a bicycle race this summer I ran 6 D700's off the cigarette lighters. Absolutely no problems. Most vehicles these days have 20 amp "accessory" sockets anyhow.

If you do you a gel cell battery in back, don't use aligator clips. Just get some crimp connectors for $0.59. Aligator clips are just asking to pop off whenever the car goes over a bump.

Take a look at aprsdPERL. It has a listening port that spawns off children as clients attach:

http://www.eskimo.com/~archer

will get you to the main page, then go to the ftp site link (on the left) and scrounge around for it. There's isn't a lot on the ftp site so you should find it quickly. It might get you up and running quickly by borrowing code or ideas. It's GPL'ed.

Problems with it: If clients connect/disconnect from it on a regular basis (like my quake and water gauge scripts do). It likes to spawn off too many children and not kill them when disconnects occur. Just a warning. I haven't gone back in to debug that problem yet. I run it from a shell script that starts it up again in case it dies also.

One thing we've found with several years of doing a bike race where the trackers are on rental vehicles is that you can feed a gel cell from a cigarette lighter or power outlet as long as you limit the current.

We found that the big Radio Shack RFI filter has the non-published effect of limiting charge current to <10A which works with most cigarette lighters. I don't have the part number handy, but can look it up tonight. One caution is that you want to provide a way of telling that you are actually getting charge current as otherwise the gel cell will mask a loss of vehicle power.

Bill

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-101388-2002.10.02-12.44.24--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

>> I need some information about what weather stations are compatible with Win APRS. I am lloking to buy a station but I want to be sure that the one I get will transmit the required data. <<

If you download and install the latest version of WinAPRS, V. 2.6.1 June 1002, the weather station configuration dropdown menu contains a list of supported wx stations.

NOTE, however, that the option that first appeared in v. 2.6.1 that allows a weather datafile written to be transmitted, thus allowing any weather software (such as Weather Display) that creates a data file to be used, presently does not work. Mark and Keith need to make a slight change to the distribution version of the software to let it read the data file. It presently generates a port not found error message if you select this option, rather than one of the hardware weather stations.

Once this feature is working, virtually any weather station can be used. I have a Rainwise MKIII station and Weather Display software which generates the correct datafile. However, until the authors of WinAPRS correct the bug, it can't be transmitted on the air. Data from my station that appears on findu gets there from Weather Display's ability to dial up an internet connection periodically and upload the current datafile to the wx server.

This is exactly what our RACES group uses every year for the Baker to Vegas Relay Race. Since we use a rental vehicle, we have to mount all the radios to the follow vehicle hours prior to the beginning of the race. We run at least 3 cables (black and red) AWG 10 from the battery out to the back of the hood and then into the cabin. We connect each cable to the battery with a big alligator clamp (Radio Shack has it, I don't have the model number handy), they are big enough to withstand any movement or vibration of the car. We use one cable for the 2 meters radio, full power. Another for the APRS box (radio 50W, TNC and GPS) and the other wire we connect an amplifier with a cd player and cassette player. Of course, all the leads are fused. We have been using this set up for years without any safety problem.

Thank you all for your ideas.

Dave corrected a mis-conception that the cigarette lighter receptacle won't
work. So, I'll make up one cable for that.

I'll also make up a cable to clip to the battery leads.

The typical problem with the cigarette lighter is that you can hear the
alternator in the transmitted signal from radios connected such. Newer
vehicles have an accessory plug which is often switched by the ignition and in
some cases goes directly to the battery with a higher amp fuse. Check your
vehicles manual for specifics, and be prepared to deal with the alternator
whine...

Rendered body type: text/plain

I have finally finished a small program that will generate a NMEA formatted
$GPWPL string and send it to the GPS. All you have to enter is the
Waypoint's name (up to 6 characters) and the Lon/Lat, generate the string
and send it. I also put in a small function to save the strings to a .wpl
file, but this still needs some work.

You can get this from my site at http://www.ke4nyv.com then click the
Software Page link. Click on WPGenv10.zip

Any suggestions and/or comments are welcomed.

Interesting article. Thanks for posting the link.

The included download for GPSboy seems to have a flaw, at least in the PC version. I loaded it and hooked it up to my Rand McNally GPS engine. Lock was quick and it started grabbing data. Lat and Lon are displayed properly on the main screen. When I hit the map button (I have a wireless network which works fine in the yard) it pulls up a map, but the longitude never strays from 111 degrees (which I think is the author's location). The lattitude is updated just fine.

I have not tested the Win CE version as I have no serial adapter for my Pocket PC (yet).

I am not sure about Cigarette lighter sockets in American made cars but alot of European/Japanese/Korean cars have a heat anticipator built into the socket. These are a series resistor which heats up when the lighter is depressed and increases the sensitivity of the bi-metalic strip which kicks the lighter out when it is red hot.   Drawing 5-10A through one of these is enough to cook the socket and start melting plastic.   Having burnt out a number of cig-sockets from assorted 4WD's and sedans I am very wary of using the cig-socket.   Accessory sockets on the other hand I have never had a problem with.

If you do try to use a cig-socket and the plug becomes warm/hot to touch after a reasonable over (2-4min) then you can be sure there is a heat anticipator in your cig-socket.

My dodge truck has a power outlet and a cig lighter outlet. You are probably right about the anticipator. The 'power outlet' won't hold a cigarette lighter in the "locked in and on" position due to the bimetalic strip missing. I never considered that a cigarette lighter outlet would be different than a power outlet.... thanks for the tip.

Wes

I am lacking contact info for the following IGates:

aprshhw.dyndns.org
gw.officine.it
marconi.ece.cmu.edu

Could the sysops for these IGates please respond off-list so I can get your email addresses.

Thanks,

Greg

> > it is not your basic program.

Just as a followup, the darn thing was broken. :-(It was a little-used unit, but had sat around HQ for a few years. For whatever reason, it truly was spewing out garbage. If anyone has one with a broken case, it might be a good parts unit. Just don't use the PC board for anything other than a lopsided frisbee. :-)

I finally got a new Garmin unit and everything is working just fine. It, too, gave me a few fits talking to the com port, but I managed to work around the problems. To those who know Basic, when I OPEN COM'd the port, most of the time, though the GPS was spewing out data, it wouldn't return loc(1) to indicate that it had bytes ready to be read. So the input$ didn't give me anything. So, I got down and dirty and right in Basic, did a inp(portaddr+5) to check the status bit, then inp(portaddr) for the data when it was ready. Worked like a champ, even at 9600 baud, as long as I was tight with the speed of the code (integers, check for > or IF/NOT instead of =, etc). But about 10% of the time, when I started the program, the com port either started to dump bytes into the buffer, or had some, loc(1) came true and the inp(portaddr) stuff was missing most of the characters. Darndest thing I ever saw.

My guess is that either Windows is doing something for a few milliseconds that turned on the port and stuff got put in the buffer, or, the TTL-level NMEA signals were right on the hairy edge of the voltages my laptop com port wanted to see. But I opened the program with a write to the appropriate control register to turn off handshaking, then did a quick check for loc(1). If true, I read whatever was in the buffer to a temporary variable, then with the handshaking turned off, the buffer stayed empty and the inp(port) stuff worked flawlessly. I guess that will teach me to try to use Basic to do anything in a Windows environment. :-) But, other than this, it was easy code and will be understood by most programmers, though some may have to dust off their Basic. :-)

If anyone is having a similar com port problem, I will gladly send them the snippet of code that solved my problem. Email me at w1rfi@aol.com, so I don't have to send the stuff to this address from home.

You guys fighting with basic should try Java. I really think you'd have more
fun, and not only that, but you'd create software that all of us could use!

48. [aprssig] Standard Vertex V-150 HT

From: Bob Bruninga <bruninga@usna.edu>
Date: Thu, 3 Oct 2002 17:45:02 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

Message-ID: <LYR842-101629-2002.10.03-17.27.11--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Regarding the VX-150 HT:

The manual has NOTHING about battery charging (that I can find).
Is the supplied wall charger a trickle charger only?  Does it rapid
charge?  How long to leave it on charge?

My guess is that it is an overnight trickle charge since no amount of time
that I have left it on charge results in any sensible heat from it..

Has anyone else figured it out?

Bob

Rendered body type: text/plain

I am trying to get a VX-150 working with a KPC 3 TNC...

I have constructed a cable which receives data fine, and keys the transmitter and appears to transmit, but I am unable to connect to any other station, or get my packet to digipeat. I am wondering if it has to do with the XMITLVL command... but I just don't know as I am so new to this.

Any guidance with this unit would be appreciated.

Thank you,

Jonathan Reid
KG4UAM

Bob, to really be sure, you'd have to measure the current the wall wart puts into the battery pack during charge. Divide the pack's capacity (700 mAH for the FNB64) by this amount and that will tell you the quickest time it will take to charge. I suspect that the wall wart is probably supplying about 45 mA, as this is a common value for several of my Yaesu wall chargers. That implies a 16+ hour charge time for the 700 mAH packs.

P.S.  don't forget to fuse both positive and negative wires coming from the
battery.
If the car battery ground cable goes "south", i.e. corrosion at the battery
ground terminal,
you  don't want your radio's ground serving as a path for cranking motor
current.....Carl

On the other hand, I saw someplace (I think it was a Chrysler service
bulletin on installing RF gear) that you should NOT fuse the ground line
because if it burned out, you'd then be in the position of using the coax
shield for a ground return. This is probably less of an issue with a
mag-mount antenna, though.

Hi Group,

  I have seen exactly what Carl said happen.  When the car's negative goes
bad the coax shield then supplies the return path for every device in the
car.  Then it goes through the negative cable for the radio but not before
it cooks the path inside the radio from the coax connection to the negative
lead.

  I ALWAYS fuse the negative on anything with an antenna!!

  AND, you will probably have to ground the radio and negative lead to the
metal of the cab if you run the negative to the battery.  I did a Ford F150
where the owner finally tossed the mag mount for an NMO mount.  Now he gets
alternator whine in Rx only.  A jumper to the cab from the rig stopped it.
Ground loop stopped...  When in doubt, ground everything!  Jump the cab to
the frame in a few spots too!  The bigger the jumper the better, I use at
least #6 stranded or RG-8 braid inside heat shrink or split loom.  Solder
all terminals after crimping.  Especially at the battery.  Stops corrosion
from the acid fumes.  By the way, the truck was brand new.  It don't just
happen on the old ones.  Sometimes the jumpers get left off or not tightened
at the factory.

Just plain old good installation practices.  TAKE THE TIME to do it right
the first time and you get no returns and years of happy operating.

73, Shanon  KA8SPW

 This is exactly what our RACES group uses every year for the Baker to
 race.  We run at least 3 cables (black and red) AWG 10 from the battery
 out to the back of the hood and then into the cabin.  We connect each
 cable to the battery with a big alligator clamp they are big enough
 to withstand any movement or vibration of the car.
 Of course, all the leads are fused.  We have been using this set up
 for years without any safety problem.

Bob,

Yaesu/Vertex prints the charging information on the
battery technical sheet and not in the user manual.

Full charge for the 700MAh NiCD battery is 15 hours
with the wall wart. Full charge with the drop in quick
charger is 1.5 hours.

The bottom line is ANY automotive installation needs to be thought out to do it with acceptable compromises.

Me? I NEVER ground to the battery. First off, why? If you ground to the battery, and the battery is not at vehicle chassis ground, then you and
your rig are sitting in a 'noise cage'. In addition, your antenna is now probably sitting on a noise generating ground plane.

Ideally, I believe you should find a low impedance to negative ground spot in the vehicle. In Chryslers, there usually are 2 or 3 manufacturer recommended spots. In my Intrepid, for example, there is one 'center console'. However that one would be 'common' with the air bag controller. And regardless of how 'good' a ground I think it is, it doesn't
give me a warm and fuzzy to ground it there. Another is in my trunk, a 'tab' on the left side behind where the left passenger would be seated. In fact, that is the recommended ground point for high power stereo systems, and where the factory Infinity systems ground. And... it is a perfect spot to ground a 'trunk mount remote' type installation, which is what I have.

Yes, hooking direct to the battery offers an advantage of the lowest impedance to the highest potential current source. But it does NOT insure the best 'ground' for RF listening.

On the other hand, grounding in the trunk or other 'manufacturer recomended' vehicle ground spots offer the best 'performance'
but at the same time may limit you slightly in what's best described as 'quiet current ' capability.

But, if you have a problem where battery ground is excessively away from vehicle ground, what's best?

It would seem to me that if that's an issue, FIX IT!!! Don't try to compromise your way AROUND the problem, FIX IT!! The
the compromises of grounding elsewhere in the vehicle are minor compared to the benefits.

It's really amazing the number of times I hear 'I won't do that because...'
and the reason is because something ELSE in the system is broke and the person just won't get off their you know what and fix it!

Be honest here... How many people do you know that expouse the benefits of grounding at the battery immediately try to tie it to a statement
that goes something like "When I hit the brakes, I get a glitch" kind of thing? It's just amazing that people won't fix the vehicle electrical system
correctly and KEEP it fixed when they are routinely installing devices to stress it!

Oh, and the ground cable fuse may NOT protect your coax. It will only insure that battery current through the ground is 'protected'. But just remember, if you have a 10amp fuse in there, what happens if the ground current is only 5amps?

Furthermore, if you have a ground at the radio chassis and a ground at the antenna... Are you going to insure that your rig chassis is insulated?
Again, you will have multiple contact points for 'ground'. The antenna is probably going to be one of them, and you probably won't have much of a choice where. The rig chassis is another potential. Ok, you can insulate that. But do you really want to? Think about that. The rig is sitting in a huge cage. Do you really want to have it isolated from any potential contacts with the cage? Remember, the ground on the mic,
a ground on a speaker wire. Even something like a metal pen you lay on the console may.... You get the idea, I hope. Think you can solve all the issues? Sure, maybe you can. Until someone comes up and says "Hey, can I plug this into your radio for a second..."

If the chassis is in cage, it really SHOULD be 'referenced' to the cage.

Again, there are benefits and compromises with almost every installation. THINK THEM OUT before you blindly accept someone elses blunt statement that "You should ....."

And make sure you're not installing a radio into an already compromised environment! (Personally, just the fact that battery straps go bad with

time is justification enough in my mind to never ground right at the
battery!)

IF you ground to the battery direct, then you should fuse the ground
line.

IF you ground to the chassis at the radio mounting point, then the fuse
is not recommended.

61. [aprssig] BATT To the Group

From: "Allen D. Alter" <n2radio@triton.net>
Date: Fri, 4 Oct 2002 12:22:13 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-101742-2002.10.04-12.03.54--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Group I'm a lil new to this Posting hope it work's &
help's.

My YEASU VX-1R has a 2 hr recharge time if you are not using
it.
My Yeasu FT 50 R Manual doesnt give any good info on Charge
time's. The book says the radio come's with a 15 hr compact
charger. Well from what I know about Nicad Pak's that's a
safe bet.
It also has a Optional FAST Charger.

I did a lot of research on Nicad paks. Here's a few tip's I
found to be very true.

1.   The Wall Wart will overcharge and destroy a pak, in
time. (not too long of time)
2.   QST had a artical a while back about making your Wall
Wart a Trickle charger, that you can leave on for ever. It
usses a Resistor in Paralell with a bypass switch. Look it
up it's very intresting. If my scanner was up and running
I'd send it to you.
3.   When you charge Nicad's in a pak it get's a lil
riskey, if you leave too much charge on you risk going into
overcharge. When that happen's one cell can Vent, and you
loose Batt Fluid. You can watch with a DIGGITOL VOLT METER
and you can see it go up and then go into discharge.
4.   You can recharge Nicad Pak's at a Much Higher Charge
Rate, than the Radio Manu. Reccomend's (when they do).

```
5.   500 Mill Pak's can be charged this way. Maybe 3 or 4
AMP's for 15 0r 20 minute's but you have to monitor them
constantly with your Dig Meter so you can shut them off at
there PEAK. It will shock you how high they will go.  DO
THIS AT YOUR OWN RISK>>>>I DO IT ALL THE TIME..
6.   I have Recharged my RC Pak's form the 12 vdc Batt in my
car. Same deal 10 to 20 Min.

> THIS AT YOUR OWN RISK>>>>I DO IT ALL THE TIME..

NEVER EVER EVER charge NiCads with a continuous current
of over 0.3c.  When you do this, the cell breaks down and you
are relying on the pressure (held in by the vent) to force recombination
of the gasses.  Even at 0.3c you are playing and 'edge' game with
the pressure.  Does it work?  Yes, but your making each cell into
a small pressure cooker.  It's only a matter of time before you hear
that firecracker go off on the bench.

Oh, and keep in mind that NiCads are EXTREMELY toxic!
Cadmium poisoning.  I wouldn't want venting on my workbench
with that fine mist ...

Yes, you can charge a totally dead NiCad in even much less than
an hour with pulse type chargers.  These can supply an average
charge of OVER 1.0c by pounding the battery with HUGE
current spikes with 'settling time' between the spikes to allow the
gas to reabsorb.  Some people even maintain that the pulse
chargers are good for the life of the batteries.  However, just
pulsing is not enough.  A lot of cells now use a 'pulse charging'
system to quickly and safely charge batteries, but where they
differ is in the way the units monitor the cell between pulses to
see what's going on.

Personally, I don't believe that pulse charging was fully explored
for extracting the maximum life out of NiCads before the laptop
industry 'moved on' to NiMH and LIon technology.  But then,
that's another issue.

>
>NEVER EVER EVER charge NiCads with a continuous current
>of over 0.3c.

As a designer of nicad and NIMH charging systems, I'm going to take the middle road here. C to 2C is standard, and recommended by the manufacturers for NIMH, but only under controlled charge.

First, realize that Nicad and NIMH are different batteries.
Nicad is a lot more robust, NIMH packs a lot more in the can.

Chapter 29 of the McGraw Hill handbook of batteries is very illuminating.

NIMH will go into charge depression if left on trickle faster than C/300 for an extended period. This is a completely reversible problem, often mistaken for "memory effect", which is essentially impossible to provoke in comsumer cells. A few normal charge/discharge cycles will erase charge depression.

Pulse charging of Nicad and NIMH is still done, and highly recommended in some quarters. The theory is that it promotes a more porous plate surface resulting in more capacity to deliver current quickly, and that the higher current levels are not conducive to denrite formation.

Completely discharging any multi-cell Nicad or NIMH pack is un-necessary, and is likely to damage some of the cells in the pack.
Discharging below 0.9V/Cell is not recommended, 1.0V if you want maximum life.

I'm finishing off a printer design right now, that uses an Atmel Tiny-26L processor as it's battery charger. The chip not only controls every phase of the charge cycle, but it also is the SMPS controller for the constant current supply that charges the battery. The high speed PWM output allows me to do 8 bit PWM at 100kHz, while operating without a crystal, on the internal 1Mhz clock.

Give me 6 months in the field, and I'll have a much better data set, since these chargers log data to internal memory, and we upload that.
I'll also have a few doing dedicated battery cycling. I've never had that capability in hardware before :)

Rendered body type: text/plain

Everyone,
I am confused a little about which APRSd I should be running at this point. I try and help maintain 3 IGATES and a SATGATE in Michigan which are currently running APRSd 2.2.3 latest from CVS, but it appears that this has none of the Q construct setup in it. I know we are still backwards compatible, but when will the latest helpful additions be added to the latest APRSd?

Is it better to switch to javAPRS??

Thanks for the help, I just want to stay up to date.

Rendered body type: text/plain

```
OK gang, (and Cap)

One of the main features of PCsat was a separate downlink transmitter on
144.39 so that we could send a message to ANYONE in north America no
matter where they were.

In the year of operations only a half dozen or so individuals asked to use
that channel.  And then mostly for uplink of posits instead of messages.

So, Tonight I am going to do a test to see who all I can send a message
to.  So I will send a message to ALL that will come down on 144.39 no
matter where you are and lets see who gets it.  When you park your car
tonight, leave the rig on and make sure your MSG buffer is not full!

By the time you go to bed, go check your messages and see if you got it...

P.S.  I need an UPLINK station on the WEST coast to do the same uplink out
there.  Cap Pennel, are you available?

Rendered body type: text/plain

```
The default geo that findU supplies with a track.cgi (and breadcrumb.cgi)
has changed.  It now shows a full map of the USA. Previously, it produced
a zoomed-in MapBlast map that depicted the local area of the track points.

What's happened?  When (if ever) will the original functionality return?

73,
   Gary Fariss, W6KYF

OK gang, (and Cap)

One of the main features of PCsat was a separate downlink transmitter on
144.39 so that we could send a message to ANYONE in north America no
matter where they were.

In the year of operations only a half dozen or so individuals asked to use that channel. And then mostly for uplink of posits instead of messages.

So, Tonight I am going to do a test to see who all I can send a message to. So I will send a message to ALL that will come down on 144.39 no matter where you are and lets see who gets it. When you park your car tonight, leave the rig on and make sure your MSG buffer is not full!

By the time you go to bed, go check your messages and see if you got it...

P.S. I need an UPLINK station on the WEST coast to do the same uplink out there. Cap Pennel, are you available?

[snip]
>What's happened?  When (if ever) will the original functionality return?

MapBlast eliminated the interface that was being used for all FindU maps.
It happens they didn't eliminate the interface at the Vicinity (parent
company of MapBlast) level so Steve was able to get mapping back.

However, to cut down on the mapping demands (and decrease the likelihood of
losing that interface as well) Steve made at least 2 changes. One is the
track map. The other is that the mapping pages no longer automatically refresh.

I'm not sure if there is a way to zoom the default map, but you can place a
geo file and map on your own site and use that for tracks.

Bill

```
>From memory ...

:KC9UMR-12:Message body goes here{01

Where the "KC9UMR-12" is exactly that many characters long ... if they just
wanted to send it to KC9UMR with no SSID it would be "KC9UMR   "

And where 01 is up to a three alphanumeric message id. They can leave the {
and everything off if they don't need an ack back.

Hi Ken
           Here are the Steps to send an APRS message manually.
1) Set the TNC unproto path to
    CMD: APZ VIA RELAY,WIDE,WIDE
    change the above digi path for your area.
2) CMD: CONVERS
    Put the TNC in convers mode
3) Type the following command.
    :KC9UMR   :Hi Ken how is everything going over there?{1
    ^             ^^^
    I             I
    colon      I
                 addressee callsign padded with 3 spaces then a another colon
then message.

The addressee is a 9 character field that is padded with spaces on the right.
So for example if the addressee has a ssid of -15 then the above would not
have any spaces addeded like so.
:KC9UMR-15:Hi Ken how is everything going over there?{1

The {1 is an APRS message number. If your friends send another
message they would use the same format but change the message
number to a {2 and so on.

Ken the  {number at the end will cause your APRS  software to send
an APRS ACK message back.

Your friends would see this ACK message on their terminal screen and
then know that you have received the message so they would know
to stop manually sending the message and move on to the next message
that they would want to send.

Hope this helped.

Disk space is cheap and RF packets are cool - so I save them all...   Here's what
I heard from PCSAT yesterday at the home station in Redmond, Wa.

73,
Bill - WA7NWP

```

Thanks to all who emailed me!! unfortunately, im only running a TT2 for the next month or so.... and my tracker appears to have been not functioning properly on my trip up here, i THINK (or hope,,,,) that i just lost a ground wire on my radio connector cable......

will find out soon... assuming i can find a soldering iron around here.... I am wondering if the GPS is sensitive enough to be mounted IN the dashbopard as I have done.... the antenna may get pulled through to the tob of the dash if i get an opportunity....

APRSdom,

We will conduct the national APRS Satellite Paging test again tonight because last evenings test fell apart quickly. One of the family cars broke down, then I was pressed in to dad's taxi service picking up the pieces all over town and was mobile in my wife's car during all passes. Further, I didnt get the word out to Cap Pennel on the west coast in time so he missed the prime uplink out there.

Tonight is not perfect either, and I will again do the east coast uplink from my wife's car as PCSATE, and cap will do it for the west coast using PCSATW again Saturday night.

You dont have to do anything, but make sure your mobile rig is ON and the message buffer has been read so there is room to receive a message from PCsat as it flies over on 144.39. Then before you go to bed, go see what you captured. The passes are between the late afternoon and 10PM or so maybe.

If you have a D7 HT, also consider setting it outside on a picnic table to see what it gets.

Oh, and send reception reports to me (not to sig) and I will summarize..

Thanks!
de WB4APR, Bob

In case you haven't seen it yet (it just activated tonight), I've activated W2AAA-1... an experimental WIDEn-N/TRACEn-N digipeater well suited to link the Toronto/Buffalo area with Rochester and points east.

75 watts & vertical Double Extended Zepp antenna on a hilltop.

Here's hoping that it will fill a gap for the APRS community while I run some configuration tests before I move it.

Just FYI.

Ev, W2EV

Rendered body type: text/plain

Ok,
This would actually allow me to run APRS portable with my laptop if I

could get this to work. I did start out with the ht in trying to program
it, but I keep getting com. failures (it says). Tried a different
computer...that didn't work. I have tried changing baud rates and that
doesn't work. Bottom line...I can't get the PC to hook up to the ht.
What am I doing wrong? It does "beep" at me (the ht) when you "start a
command"...but that is far as I get.
Help!
Robert

Why the GPS-35? The GPS-16 is the same price + it has WAAS.

BTW, I'll be buying a qty of these in the very near future and would be happy
to add anyone else to the list if they want one. E-mail me off SIG and I'll
let you know where I am at. Should firm it up by Tuesday. Price should be
around ~$140 + shipping depending on what kind of mount you want (none or the
mag mount).

>From looking at the specs, it appears that the GPS 16 is the sucessor to the
35. It even has the mag mount option for $9. To keep with the recommended
HVS model, there does appear to be a HVS version of the 16 which accepts
6-40 V DC unregulated. They even put the RJ45 on the cable end for you.

> Why the GPS-35? The GPS-16 is the same price + it has WAAS.

Hi Jeff (and group),
I chose the '35 because it was on closeout back a couple of months ago from some unknown someone for $85 or so and was hoping to take advantage of any left over. I happened to run across the "special closeout" doing a yahoogroups message search to find a member of a yahoogroups list who "found some at a good price" and was arranging a group purchase of same. They never ID'd the source...so I don't have any way to follow up to see if there are any more or not, but I sent the "arranger" a note, just in case.

All that being said, a GPS-16 is fine...but simply potentially more expensive.

'just 'cause you asked. :-)
Ev

Rendered body type: text/plain

I have one of each. The 35 is smaller, the size of a small PC mouse. The 16 is twice as large, the size of two hockey pucks taped together. I bought them both at www.GPSCITY.com. I see know they have a cheaper GPS made in Taiwan.

WAAS is nice, but not always there. The RJ-45 is a small connector, but doesn't "connect" to anything that I know of in the HAM world....yet.

So you got to cut it off, or use a male-to-male RJ45 adapter and some CAT 5 cable to an adaptor, which I have done.

Rendered body type: text/plain

Hi Ken,
This helps me a lot, actually. Thank you for sending it along! It has shown
that I need to dump WIDEn-N ID TX's for this test. I need to better understand
the paths that W2AAA-1's packets are taking, so I'll be changing to launching
via TRACEn-N only (though I'll still process WIDEn-N requests by others).

It looks like things appear to be working so far. My goal is to get a path from
W-NY to New England and New Jersey via all-RF (to link areas of high Amateur
uWave activity). It looks like that's quite possible given what you received.

Thank you sincerely for the help!

Warm regards,
Ev

I mounted an RJ-45 keystone jack in a small Radio Shack project box and
brought out the appropriate wires to various jacks - A 6 pin mini-din for
the FT-8500 and a DB-9 for the second (software) serial port on the
KPC-3+.   I also power the TNC through the 2nd serial port, which makes for
a very clean installation.   Power for the GPS and TNC are supplied into
the project box via a fused pigtail terminated with an Anderson
PowerPole.   I use pre-made cables to get data to the TNC and transceiver.

I soldered all connections to the DB-9 and 6-pin mini-DIN and then punched
down the wires on the RJ-45 jack appropriately.   This was very easy to do
and has served me well for 4 years.  The really nice part was that I just
soldered fairly long wires to the jacks, and then mounted everything in the
project box and then ran wires to the keystone jack.  Punching down the
wires meant no soldering inside the project box and that I could route the
wires in the best manner possible.   It would've been a nightmare to solder
all the wires up and then try to mount the jacks in the project box.    I
even have some no-tool RJ-45 jacks these days...

I also wanted the ability the use my RJ-45 plug equipped GPS-36 with a
laptop, desktop, or hand computer (RS-232 port); so I bought a modular
female DB-9 to RJ-45 jack adapter; the kind commonly seen on the backs of
POS terminals.    They cost about a buck each and are designed to be custom
pinned.  I drilled a small hole in the shell of the adapter and ran a
pigtail out for power - again terminated with a PowerPole.   But, depending
on the GPS you have, one could terminate it with a PS/2 plug and power the
GPS via keyboard port.

73,

Mark
KC7BXS

Hi Jeff (and group),
I chose the '35 because it was on closeout back a couple of months ago from
some
unknown someone for $85 or so and was hoping to take advantage of any left
over. I happened to run across the "special closeout" doing a yahoogroups
message search to find a member of a yahoogroups list who "found some at a
good
price" and was arranging a group purchase of same. They never ID'd the
source...so I don't have any way to follow up to see if there are any more
or
not, but I sent the "arranger" a note, just in case.

All that being said, a GPS-16 is fine...but simply potentially more
expensive.

'just 'cause you asked. :-)

I am running Win aprs CE on a jornada 680. I am connected to the internet
via the Denver I gate server. Is there a way that I can set my path to relay
that signal that I am feeding into the I gate into the system for 144.390? I
would like to be able to see the packets that I am sending via the net on
the aprs tracker I have set up in the truck. Any suggestions that I can get
would be helpful.
thanks
Dakota

Rendered body type: text/plain

ISS and PCsat affectionados:

Today and Tomorrow the plan was to conduct a joint ISS/PCsat packet experiment, but due to the complexities of coordination we probably won't know for sure until, or if it happens.

So if you are monitoring the downlinks today, be aware that you may find ISS on its normal freq of 145.800 or it may be over on 145.825. If it is on 145.825 we hope it will respond to these aliases:

RS0ISS, ARISS, WIDE, and possibly W3ADO-1

In any case, it will do callsign substitution and the packets will come down as via RS0ISS*. The fun part will be the fact that both ISS and PCsat are mutually in view during these times:

Oct 7	1209z - 1550z, 1600z - 1630z
Oct 8	0555z - 0613z, 0633z - 1015z
Oct 9	0017z - 0400z, 0417z - 0435z

If ISS or PCsat passes over your location during any of these time frames, there is the SMALL possibility that you might be able to do a dual-hop packet from one to the other spacecraft. The only difficulty will be QRM. So it is best to NOT hog the channel, but set your path and then sit back and transmit a packet once a minute or so, and after it is all over, we see what happened.

Also, as of Sunday, PCsat is back in negative power budget and will only be working when it has been in sun for 10 minutes or so to give it time to charge up. THis means YOUR pass must be after about 9 AM your local time (1 hour on the ground equals 4 minutes for PCsat)

Then again, none of this may come to pass... due to difficuties of scheduling. But since 7-8 October was the last plan I heard, I figured I may as well alert everyone to be watching...

You don't normally want to gate packets full time from the Internet to RF as the
RF net has limited bandwidth.

If you're in a region with limited activity - tjos could be a good thing to
stimulate more activity and interest.  In that case, contact your local Igate operator
and ask him to add you to his 'gate2rf' list.

To get your position sent to RF, simply send a message from the Internet
connected system to any station on the RF system.  The Igate handling the
message with then send out your position report on RF so folks can see where
the message came from.

A third option is to set up an Igate of your own on a different frequency and
gate your and LOTS other of the Internet packets to RF..

Hope that helps.
73,
Bill - WA7NWP

Robert,

Maybe someone has already answered this. If so, great.

But I couldn't figure out which program you were using to program the D7.

I think one thing you must do with the D7 is turn off the internal TNC --
make sure PACKET or APRS are not in the display.

For what it is worth, fellows, you can also digipeat APRS through other
satellites besides ISS, SAREX, PCsat and UO-22.  You can also now use
sound card software to go via the old 1200 baud PACSATS (AO-16).  Here is
a note on the AMSAT-BB about it..  You can use 2m FM on the uplink, but
you need a UHF ssb RECEIVER for the downlink....  de WB4APR

Hi Don.

> I decoded the following from AO-16 this morning using MIXW and my
> soundcard. What setups are others using to digipete through AO-16?

I used Douglas KA2UPW's UPW program at
http://members.aol.com/dquagliana/upw/ for the uplink and, like you, MixW
for the downlink.

This allows digipeating of messages.

http://www.g6lvb.com/images/mixw2-2.jpg has a pic of this.

Ignore my post about a possible joint ISS/PCsat test. We were just not able to get this scheduled and now PCsat has reset and is back to daytime-only operations with its batteries going dead into eclipse.

But the good news is that even after more than 2500 deep cycles on its AA nicads and a year in space with only 5 of its 6 solar panels working, PCsat ran well past its last full sun period (ended 30 sep) and got down to 33% eclipses before it reset last night (6 Oct). (35% are its worst case).

Also this last weekend we conducted a nationwide paging test which I will summarize in a following post. Everyone is welcome to continnute to use PCsat as a digipeater while she is in the sun. Though she usually only wakes up after about 16 minutes in the sun (usually after 10 to 11 AM your local time)...

124. [aprssig] A ccautionary note: bugbear virus message masquerading as keps

From: Rich Osman <Rich@Osman.com>
Date: Tue, 08 Oct 2002 04:15:54 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-102138-2002.10.08-04.59.11--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I got this in the morning email. The attachment is the w32.bugbear mailing worm.

It's unlikely that <I6KZR@xmission.com> has anything to do with this beyond being in someone else's addressbook, but I've mailed him anyway.

I'm pretty careful, but I got nailed by this one last week. If you get the virus, look here for authoritative information on detection and repair:

http://securityresponse.symantec.com/avcenter/venc/data/w32.bugbear@mm.html

125. [aprssig] No More GPS35-hvs deals known

From: "Ev Tupis (W2EV)" <w2ev@arrl.net>
Date: Tue, 08 Oct 2002 06:47:12 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-102156-2002.10.08-06.30.51--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
After my last posting, I received a message from the person who arranged for the
purchase of the '35-hvs earlier this summer.  They are all gone (from their
source, anyway).  I'll continue to scour the 'net... but I got so many emails
from others who wanted to join me in my purchase (if I ended up being
successful) that I thought I'd just make a blanket announcement of my failure.
:o)

Regards,
Ev, W2EV

Rendered body type: text/plain

```
Does anyone (Sproul's???) have or know where to get the file/record layout
for the FCC Call Database as used in WinAprs???

Seems to me, it would be nice to be able to use the data with other or
my own apps?

Doug/KC7IMR

Trying to establish voice contact ... please yell into your keyboard.

The database definitions are available from the FCC. There are links to
this info on

http://wireless.fcc.gov/cgi-bin/wtb-datadump.pl

I think the FCC even gives you the SQL needed to set up your own
database.

128. [aprssig] ISS/PCsat joint-operations test

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 8 Oct 2002 09:17:31 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-102168-2002.10.08-08.59.59--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
To all ISS Packet operators:

The ARISS team has agreed to a limited test of the ISS packet system as a
dual-hop constellation with PCsat.  This means that the ISS packet system
will be temporarily QSY'ed to the 145.825 MHz simplex frequency of the
PCsat digipeater so that the two satellites can operate together.  The
objective is to see if the satellites can be used to relay packets from
each other to extend the range via a dual-digipeat hop.  THe duration of
the test  will be about a week or more depending on the needs of the ARISS
radio.  If the crew wants to operate voice, they will QSY back to 145.800.

The precise scheduling of this test is hard to predict but it could be any
day now (8 Oct).  SO if ISS users do not hear ISS on 145.800 as usual,
they should check to see if it is on 145.825.  If so, QSY and operate
normally there.  That means, UI digipeating of very brief user packets is
welcome.  But use your tracking program to also look for DUAL-HOP
possibilities with PCsat.

IF you are in range of ISS, and ISS can see PCsat, then set your unproto
path to UNPROTO CQ VIA RS0ISS,W3ADO-1.

IF you are in range of PCsat and PCsat can see ISS, then set your unproto
path to UNPROTO CQ VIA W3ADO-1,RS0ISS

If you are not 100% knowledgible about how UNPROTO path works, please do
not transmit, but just see if you can capture one of the successful
packets from someone else.

Please do not XMIT too much.  The probabilities of success are very very
limited by QRM, so it would be best if each person only transmitted a few
packets a minute and let others have a chance.  And if you live in a good
REMOTE location, far from the USA and Europe, then your best contribution
will be to LISTEN to see if you receive any dual-hop packets.  If too
many people begin transmitting more often, then the test will fail.

SUCCESSFUL packets will be received like this:

>From ISS to PCSAT:   SENDER>CQ,RS0ISS,W3ADO-1*:....
>From PCsat to ISS:   SENDER>CQ,W3ADO-1,RS0ISS*:....

If anyone captures such a packet, then please report it.  You can also
look for potential successful packets on the ISS and PCSAT web pages:

  http://www.ariss.net
  http://pcsat.aprs.org

BUT REMEMBER, that PCsat has now entered eclipse season and ONLY works in
full sunshine, so do not attempt any transmissions via PCsat in the DARK
or even in the first sunshine.  Give it 10 minutes after entering the
sun to charge up enough to be able to digipeat.  Originally this test was
to have both ISS and PCsat using the generic APRS digipeater aliases of
WIDE so  that users could use UNPROTO CQ VIA WIDE,WIDE.  But since PCsat
cannot remember its settings orbit-by-orbit due to nearly dead batteries,
it is best if you use the exact callsigns noted above.

For today and tomorrow, PCsat and ISS are mutually in view during these
times:

Oct 8           0555z - 0613z, 0633z - 1015z
Oct 9           0017z - 0400z, 0417z - 0435z

If ISS or PCsat passes over your location during any of these time frames,
```

there is the SMALL possibility that you might be able to do a dual-hop
packet from one to the other spacecraft.

Enjoy the test. Limit your transmissions.   Concentrate on what you
can capture...

I also received one yesterday from this address but my ISP's filtering
software removed the virus. I6KZR is bogus, there's no such user at
xmission.com.

Rendered body type: text/plain

With MixW32 soundcard software, what mode do you select to copy AO-16 PSK
activity?

Where do I find it in the menus? I only see PSK31 variations, but nothing
for just BPSK.

Tnx, next pass in about 20 min

tnx much,

73, hasan

Aha! Found it...set MODE for PACKET, then go into Mode > Mode Settings and
select the right modem...it says "satellite PSK".

I don't know of any other changes at this point, but I'm listening on
437.051 +/- doppler and I'll post what I find.

Well, it works pretty decently. I do need a fairly strong signal. In the
waterfall mode, set your freq with the mouse on the bright band in the
center. Doppler correction is essential. TRX-Manager and Nova seemed to work
as I would have expected. I got quite a few frames. MixW32 worked just
dandy.

Mode > Packet > Mode Settings > Choose PSK Satelltie Modem

Well, it works pretty decently. I do need a fairly strong signal. In the
waterfall mode, set your freq with the mouse on the bright band in the
center. Doppler correction is essential. TRX-Manager and Nova seemed to work
as I would have expected. I got quite a few frames. MixW32 worked just
dandy.

This was copied today by the KB8ZGL-5 satgate in Grand Rapids, Michigan
from PCSAT
KK5DO>RS0ISS,W3ADO-1*,AI5TX-2,APRS/1:=2941.80N/09534.52W-Bruce in
Houston EL29fq

I assume that means the test worked, and KK5DO went via ISS to PCSAT and
to the IGATE.

Also, was on W3ADO mobile just before this packet arrived.

Great test, excited to watch further results.

No.  I saw that packet a few days ago also, but looking closely the TOCALL
is RS0ISS, not the digi call.

Bob

Rendered body type: text/plain

I just finished reading the FCC decision on 406 MHz Personal Locator
Beacons (PLB), released yesterday at:

http://hraunfoss.fcc.gov/edocs_public/attachmatch/FCC-02-271A1.pdf

It states that

<quote>
"EPIRBs and ELTs designed to transmit distress signals on 406.025 MHz
transmit short, digital signals to provide distress alerting in
emergencies, and use 121.500 MHz to provide homing. The 406.025 MHz
digital signal contains information on the type of emergency, the
country and identification code of the beacon in distress, and other
information to facilitate SAR operations.
</quote>

Would these devices be able to include GPS and could location data be
part of the "other information to facilitate SAR operations"?

I mean, if your infrastructure is there, why not go for the full mile
and offer the option to include this information.....or is this info
available on the 121.5 MHz signal?

I guess I need to read up a bit more to get a better understanding of
how this works. Any good links are very much appreciated.

```
Greetings from Connecticut,
The W1GTT-15 digi, in Connecticut, is off the air because of a failed transceiver. It has been in almost
 constant use as a digi for close to 6 years. It was a Yaesu CPU-2500R and it has been repaired a few
times, but now I want a commercial radio to replace it.  The site of the digi is at a commercial tower
installation with lots of RF around. That's the reason for a better piece of equipment.
I've contact Buck Rogers, but he no longer sells the radios modified and ready to go, only unmodified
with instructions on how to do the modifications. I don't have the time to do the mods.
I'm in the market for a commercial radio ready to go on the 144.39 APRS freq. or a recommendation for a
GOOD amateur radio to fill the need.  I'm using the KPC-3 Plus TNC.
Any recommendations??

I receive the list in digest, so if you have any thoughts on this, please send direct to my email.

73  Bill, W1GTT@AOL.COM

Everyone,
I am confused a little about which APRSd I should be running at this
point.  I try and help maintain 3 IGATES and a SATGATE in Michigan which
are currently running APRSd 2.2.3 latest from CVS, but it appears that
this has none of the Q construct setup in it.  I know we are still
backwards compatible, but when will the latest helpful additions be
added to the latest APRSd?

Is it better to switch to javAPRS??

Thanks for the help, I just want to stay up to date.

Mike

The 406 MHz ELT/EPIRBS can contain GPS info and some of them either have a
built in GPS or a NMEA port for one.

There is a batch file which comes with the pmap ocx file. You need to run
it per the instructions contained in the winaprs docs available at the
rutgers web site for winaprs.

If you are running win2000 or other winNT derivation, there are extra instructions.

Wes

Rendered body type: text/plain

Hi Alex et al,

What you are in effect describing, is known as a GPS EPIRB, G-EPIRB or GPIRB (gee-pirb or je-pirb). There are two sets of satellites in use in the international search and rescue satellite structure. The newer are packages on geostationary birds which pick up 406.025 MHz beacons (EPIRBs or ELTs), specifically those beacons with positional information in their cry for help. Coverage is good except for the polar regions since they don't "see" them as well, so roughly 70 deg N to S Lat. Distress site location ID is quick since co-ordinates are provided.

The earlier polar orbiting SARSAT/COSPAS satellites are still up there, mostly on WX sats if memory serves correctly. They're still using doppler shift to fix the beacon position if no location is forthcoming from, say, a GPS feed (or LORAN C. It's not dead yet!) If memory serves correctly on this point, digital position info, if available, is stored and forwarded if there is no Local User Terminal (LUT) or ground station in the footprint when the signal is picked up. New legislation is phasing out 121.5 MHz primary alerting in favour of 406.025 MHz with the VHF freq for homing as you point out.

While we don't like the high doppler shift on UHF for our comms purposes, voice or digital, like APRS (SIG content!), it apparently allows for quicker position fixing than does the VHF signal. More SAR units or regular vessels have VHF DF capability vice UHF.

So, you have a good idea, and it's done for aero and marine SARSATs. ACR even had an optocoupled unit which included a Garmin Etrex and cable though one could use a fixed GPS RX updating the unit until it was released. Simple beacon identification is included which when matched against database information from obligatory registration allows rescue co-ordinators to call the company, vessel or A/C owner, other contact numbers, etc. to determine if the unit is alongside, on the ground, in the pub, out for servicing, in the post!, etc. Lot's of false alarms.

To answer your other question, there is no digital info on the 121.5 MHz signal and that will not likely be implemented. 121.5 MHz was used for beacons initially since satellites didn't exist and one counted on high commercial and military air traffic listening on 121.5 and 243.0 MHz (second harmonic).

Given the high cost of any decent beacon, for aeronautical or marine purposes, I'd plunk down the extra bucks for a float free, auto G-EPIRB if I was going off shore.

```

```
Do I need an HSP cable to use both the GPS AND computer on the KPC3+?
If so, then I guess using a palm pilot AS the computer is out....
Although I could use an 8051 to crate something of a "smart" hsp
cable...  Any ideas?  Help?

Tha online manual isnt very helpful.

On the 3+ there's an additional two port pins available to plug the
GPS into.  I think it's on the same connector as the radio port?
You just need to hand-wire a special connector that'll hook both the
radio and the gps into the same connector.  You then plug the
computer into the normal port.

Rendered body type: text/plain

Has anybody attempted to convert any R/C equipment to 6 or 2 meters to be used for other purposes? (remote wx stn or ???). It looks to me that some of that junk might have been state of the art 5 or 10 years ago and now some of it is on e-bay dirt cheap. Then after you get the remote wx stn up, you can build robots with the servos.

Just a thought, probably more trouble than its worth.

Ken,

The 3+ will use both the GPS AND your computer, no problem. The GPS hooks up at the radio port and your computer to the rs232 port. As I recall, the info was in a how-to addendum and not in the main book?

You can also power the GPS and the TNC thru the radio port. Makes a clean install.

I'd check the "Questionable" web page for pinouts, I'm sure he must have
the info there. If that fails, get back to me and I can dig mine out when
I get time.

Rendered body type: text/plain

We saw ISS on 145.825 for joint ops with PCsat for a few hour
this afternoon, but as of this writing, she is back on ISS freq.

Gil Carman at JSC computed times when PCsat and ISS are in range. His
predictions INCLUDE the 3 planned ISS maneuvers over the next 2 weeks.
If you have a pass of EITHER spacecraft during these windows, you have a
chance at witnessing a double hop path. Gil notes that Saturday around
19:50 UTC looks like a good chance for a "double hop" link over the U.S.

Here is about 1/3rd of his list. I removed all times when the range was
greater than 2000 km between them. For the full original list, see my
ISS-FAQ web page: http://www.ew.usna.edu/~bruninga/iss-faq.html

Hi Ken
Yes the KPC3+ will do what has been described.
But as I recall the original KPC3+ did not have the "Software port".

My question is what ver does Ken have to see on his terminal screen (after doing the CMD: VER command) for his KPC3+ to have the "Software Port"?

Let us hope we never witness the "Silence Of The Hams"

It might be fun if there were some ground digi's on 145.825 that would relay
between sats on the more distant separation passes. Are there any
opportunities to try a tripple hop somewhere Bob?

KPC3 is version 6.0 I have one here as backup but no software switching.

The KPC3+ does have software port switching but I don't know exactly what
revision started it. I believe it was just before 8.3

Kantronics version numbers are VERY confusing and there are different
versions
of ver.X that you can't tell from the sticker. Need to power it up to tell.

>cable... Any ideas? Help?

The KPC3 passes GPS through to the host, if the host asks for it with ^E.

Smart HSP is almost an oxymoron. It's possible, IF you have a reliable way of detecting that device A has stopped talking, and switching to device B while assuring you aren't switching into the middle of something it's saying, and of course you'd have to do the reverse.

I've proposed a solution to this several times, that basically puts multiple serial devices into one port, with no switching or loss of data, but nobody seems interested. Back at verifone, I made devices that move packets of data equivalent to money around, I think I can handle some less critical stuff.

There were days..
I am still amazed that nobody's hacking those terminals.
The programming language is such that bankers and marketing people can learn it, and you can edit the terminal code by hand, standing at the terminal.  Try <function> <recall> 101 on any TRANZ terminal.

Correct. Got to have version 8.3. (Buddy has KPC3+ with 8.2 firmware and
doesn't have the software port. I have 8.3 and have it.)

Note that firmware version is not a reliable indicator of which Kantronics
device you have. Version 8.2 is available for most of their line.
```

Every Kantronics TNC that I've have and there are many,
have the version on the sticker. Maybe if yours is used, the
previous owner took it off the chip for some reason.

It'll be somethin' like:

KPC-3P 8.2
Copyright 1997
Kantronics Co., Inc
All rights reserved

In the example above, the 8.2 is the version.

Re-read my post. I never said anything about the version sticker not being
on there.
Kantronics does do modifications/updates to firmware without changing the
version number
on the label each time. Your unit may say 8.2 but boot it up and see what
comes up on screen, it
may or may not be the same thing!

Please read first before reply!

Rendered body type: text/plain

Someone offered to burn a couple of 27C512 chips for use with UI-DIGI on a
MFJ 1270 but I seem to have lost the message when I cleaned up my old
messages.

I have two 1270's that I plan to use for two digi's in the Louisville area
but don't have the chip programmer facilities.

The person was going to put UI-DIGI on one half and the standard TAPR
software on the other half so I would have the ability to tune and calibrate
without switching the chip.

If the offer is still available, please contact me either direct or on sig.

Thanks

function SetDomain(d) { document.domain = d; }Lead pipe cinch.

All it takes is the RF section. The encoders and decoders are simple IC's as are the servo's. Input is usually via a pot as is the position feedback in the servo. A friend used these in a datalink project for instrumenting drones.

You have 2 to 8 TDM pulse width channels and a synch pulse. After the receiver they are demux'd and each pulse sent to the correct servo. In the servo is also a PWM controled by the feedback pot and a comparator to detect which pulse is longer. Based on that, the motor is driven for a few ms in the direction to match pulse widths.

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-102456-2002.10.11-16.01.06--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

To the group

This has been going for some time. As described in an earlier thread, while monitoring FINDU at work during the day, my jeep (with a D-700 and GPS-II+) will "move" back to my home location and then "back" to the parking lot outside. The 2 locations are apporximately 10 miles apart.

Today, I captured the various packets involved as reported by FINDU and cross referenced with the APRS World site (http://www.aprsworld.net/).

10/11/2002 14:17 (Location of my house, vehicle parked at work)

3.9 miles southwest of DAYTON, OH

Report received 2 minutes 8 seconds ago

Raw packet:

```
KA0AZS-7>DJ4Y1P,W8APR*,WIDE3-1,qAR,WB8NUT:!3941.24N/08412.91WjAPRS QRT @172035z
```

****

10/11/2002 14:59 (Location properly displayed at work location)

5.7 miles northeast of DAYTON, OH
Altitude: 874 feet
Report received 12 minutes 33 seconds ago

Raw packet:

```
KA0AZS-7>DJ4Y1P,W8APR*,WIDE3-1,qAR,WB8NUT:'p` l"dj/]"6{}
```

APRS World also showed the correct Status line as set in my D-700:
Custom Kenwood D700

****

10/11/2002 16:06 (back "home")

3.9 miles southwest of DAYTON, OH

Report received 22 minutes 13 seconds ago

Raw packet:

```
KA0AZS-7>DJ4Y1P,W8APR*,WIDE3-1,qAR,WB8NUT:!3941.24N/08412.91WjAPRS QRT @172035z
```

Anybody have any ideas about what is causing this? Or where to start looking?

Thanks and 73

Randy, KA□AZS

What's everyone's favorite gps unit to use with the D7 while hiking or biking or walking around? I have an emap which is great for use in the truck (external antenna, etc.), but I'd like a more weatherproof and rugged unit for use with the HT. Etrex vista? GPSMap 76? Any opinions?

> I seem to remember that there is a chip that doesn't work quite right for APRS and wanted to make sure that this is not it.
>

You want to replace ANY OEM 27256 eprom with one containing the UI-DIGI firmware, developed by Marco Savegnago IW3FQG, that converts the TNC2 device into a DEDICATED APRS-specific digipeater with the stations callsign, lat/lon, beacon messages, default paths, etc "frozen in stone". (The standard code is overlaid with a customizing file containing your specifics before programming the eprom).
This way power outages, accidental resets, etc don't cause your setting to be lost -- very important when the digi is in a hard-to-reach location.

Standard TNC2 firmware has NO APRS-specific intelligence and can't do WIDEn-N callsign-substituting digipeating, dupe-checking, etc.

More information at:
http://gw.ir3ip.ampr.org/~iw3fqg/uidigi.htm

As I have mentioned on this list before, I am able and willing to program eproms if you email me the editited overlay file and postal-mail me a blank eprom.

I have also recommended that you use a 27C512 instead of a 27C256. This way the orignal code (or a generic TAPR TNC2 Ver 1.1.9) can be kept in the ROM along side the UI-DIGI code. This is useful since the UI-DIGI code DOES NOT contain the standard CAL command used for setting the tone freqs, deviation, etc. If you don't make a "double-decker" eprom, you will have to unplug the UI-DIGI rom and plug in the original one whenever you do maintainance or testing.

To use the "double-decker" eprom, all you have to do is bend pin 1 of the eprom outward so it misses the socket and connect it to a single-pole double-throw switch so that you can either ground the pin or connect it to +5 volts. This pin is actually the MSB (most significant bit) line of the eprom and selects either the upper half or the lower half of the space in a 27C512.

Rendered body type: text/plain

Hi all,

I recently attended a meeting sponsored by the Cherokee County (NC) Crime Commission regarding the introduction of the Amber alert system into our area, the North Georgia Mountains, Western NC and SE Tennessee. Amber Alert is the program in use in many jurisdictions to alert the public of a child abduction when the child's life may be in danger. They want ham radio operators involved to help get the word out.

I told John Veach, KE4D, about the meeting and he suggested APRS as a method of getting the word out to a lot of hams quickly.

What would be the best way to issue these alerts on APRS and should we APRSers set up a standard protocol for using it? They don't need to be national, but do need to cover large regions, and usually include the child's description and vehicle description of the abductor's vehicle.

Please cc:mullinix@tds.net on all responses. I suscribe to the digest version of the sig.

Tnx es 73

187. [aprssig] Saturday ISS<==>PCsat test!

From: Bob Bruninga <bruninga@usna.edu>
Date: Sat, 12 Oct 2002 11:37:04 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-102502-2002.10.12-11.19.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Saturday 12 Oct ISS<==>PCsat COMMS test

NZ, UK, Miami, San Diego and Hawaii hams PLEASE READ!

To have any chance of a successful double-hop digipeat between PCsat and ISS, requires a clear channel. Therefore everyone who will not be successful, please do not transmit! Only the one or two lucky packets that might be successful should be transmited!

That said, lets all hope for hamdom's success by helping that successful packet get through. That is, dont transmit... unless you know exactly what you are doing... and have a BEAM and a shot out over an ocean... If both are in view ALWAYS TARGET ISS FIRST. Save the power on PCsat for only the successful packets.

The digi paths are ISS = RS0ISS, and PCsat = W3ADO-1. I will abbreviate these in the following GREAT opportunities this afternoon using the abbreviations of ISS and PC..

1920z Someone in Southern NZ has an excellent 3 hop chance with the path ISS,PC,ISS while ISS is in view and PCsat is over the pacific with NO ONE in view. But this will ONLY work at the very end of the ISS window when PCsat has had a few minutes to get enough sunshine to charge up. DO NOT Send anything via PCsat as it goes over earlier, or you will kill your chance of success. Give PCsat the longgset possible charge time before your attempt. You only have one shot.

1942z SOCAL and FLA get an excellent dual hop shot for a minute or so as ISS rises over pacific in SOCAL and PCsat rises over Carribean in FLA. SOCAL users try ISS,PC and FLA users try the reverse.

1950z ZOO time. Both sats inview of USA and unless everyone is quiet, nothing will get through. Do NOT TRANSMIT TO PCSAT to save its very weak batteries. Hit ISS first, and if that is successful, then let it hit PCsat next. THus, PCsat only is used for SUCCESSFUL DUAL HOP packets.

2000z GREAT chance for NewEngland and UK. ISS is over atlantic out of sight of everyone. PCsat is above it. Time for about 1 minute of shots from either side of the atlantic for a tripple shot using the path of PC,ISS,PC IF there is anything left in the batteries after the USA zoo.. and if everyone is quiet!

2007z ZOO over Europe! And PCsat is out of sun and probably dead. Again, do NOT target PCsat, aim for ISS to PCsat.

2057z NZ gets another EARLY AM chanec to do ISS,PC,ISS while PCsat is over the ocean and ONLY at the very last minute to give PCsat the best chance to have charged up enough to transmit ONE good packet.

2111z ISS over Hawaii, and PCsat over Pacific! NO QRM ON EITHER END! This is the best shot. Wait till later in pass for PCsat to get best charge. Use ISS,PC,ISS!

2117z ISS West coast pass! ONE guy shooting out over Pacific using ISS,PC,ISS path might have success.

2125z ZOO over USA. DO NOT TARGET PCSAT. Hit ISS first.

2138z PCsat over USA and ISS isolated over Atlantic. Use PC,ISS,PC

2147z UK has shot through PCsat to ISS isolated over Atlantic using path of PC,ISS,PC. But PCsat probably dead by then.

Good luck those of you with good shots out oer the ocean and good stations. Everyone else dont transmit! Well, though, we all must, so lets set a limit to 1 packet per minute and make it the shortest possible packet with your GRID in it so that we minimize our QRM to those special stations that might have a chance.

Use a D700, D7 or Mic-E to set EMERGENCY and then also send a BULLETIN
from the same radio with the AMBER alert in it. No one can miss that.

Just this morning, I Was talking to a neighbor that just had a new kid.
As a new father, he checked the WEB for Perverts in the area, and said the
guy 3 houses down is listed by the state as a convicted child molester!
Wow, we have lived here 12 years and so has the pervert, and my kids have
grown up from 1 year old to 13 years old in this neighborhood. So my wife
was RIGHT to never let our kids leave our yard without us along. I always
thought she was crazy..

We did report the guy once for catching cats and burning them alive
with gas... Never new it could have been our kids...

Bob

We need to work with the state agencies to automate this process. Work is
being done on other community warnings / information and this is clearly
another one for the list.

Without drifting too far off the APRS topic, I would caution people NOT to
over-react to local databases of registered sex offenders. As a police
officer in the city reported by 'Americas Most Wanted' to have the highest
percentage of registered sex offender per capita, I caution people that more
dangerous than the registered sex offenders (who we watch daily) are the
ones living next door who haven't been caught yet! Don't be lulled into a
false sense of security because your block doesn't have a registered
offender listed.

OK - who's going to step forward and suggest APRS trackers for all
registered sex offenders?

The NWS is issuing Amber Alerts now as Civil Emergency Messages. The files can be downloaded from anonymous FTP somewhere (along with other active weather products from NWS), I just can't remember where. The easiest way would be for someone to write a program to pull this data down, parse it (simple), and generate a message. Unfortunately, they tend to be quite verbose.

Here's an example of the most recent one:

WOUS44 KFWD 091634 CCA
CEMFTW
TXC001-027-035-085-093-097-099-113-119-121-133-139-143-145-147-161-

BULLETIN - EAS ACTIVATION REQUESTED
CIVIL EMERGENCY MESSAGE...CORRECTED
TEXAS DIVISION OF EMERGENCY MANAGEMENT
ISSUED BY NATIONAL WEATHER SERVICE FORT WORTH TX
1015 AM CDT WED OCT 9 2002

..CORRECTED LICENSE PLATE NUMBER AND CONTACT INFO...

THE FOLLOWING MESSAGE IS BEING TRANSMITTED AT THE REQUEST OF THE TEXAS DEPARTMENT OF PUBLIC SAFETY.

..AMBER ALERT...

NICOLE LIGHTFOOT HELLMAN...AGE 14 IS BELIEVED TO HAVE BEEN ABDUCTED ON OCTOBER 5...2002. HER LAST KNOWN LOCATION WAS IN AUSTIN...TEXAS. SHE IS WHITE...4 FEET...10 INCHES TALL...WEIGHS 75 POUNDS...HAS BLONDE HAIR AND HAZEL EYES. SHE WAS LAST SEEN WEARING FLARED DENIM JEANS...A PALE PINK RIBBED TURTLE NECK...AND WHITE NIKE TENNIS SHOES WITH A GREEN SWOOSH. SHE HAS BRACES ON HER TEETH.
THE SUSPECT IN THE ABDUCTION IS LOIS RENAE LIGHTFOOT...AGE 32...WHITE...HEIGHT 5 FEET 6 INCHES...WEIGHT 115 POUNDS... SHE HAS BROWN EYES AND DIED BLONDE HAIR.

A SECOND SUSPECT IS JAMES TODD WESTMORELAND...AGE 37...HEIGHT 6 FEET 0 INCHES...WEIGHT 183 POUNDS. HE HAS GREEN EYES ...BROWN HAIR AND A MOUSTACHE.

THE VEHICLE USED IN THE ABDUCTION IS A WHITE...1999 CHEVROLET...
MODEL Z-71 WITH TEXAS LICENSE PLATE 2JVL61...STANDARD CAB.

IF YOU HAVE ANY INFORMATION REGARDING NICOLE LIGHTFOOT HELLMAN...
PLEASE CONTACT YOUR LOCAL POLICE OR THE ELKO NEVADA POLICE AT
775-777-7327 OR 775-777-7321.

[15:56:24] KB2M-3>SYQQ0W,W3ADO-1,RS0ISS*/1:'fH~l j/]www.qsl.net/kb2m

[15:56:27] KB1GUE>CQ,RS0ISS*,W3ADO-1,SGATE,WIDE/1:>FN42IL/- CQ from Glenn
[15:56:28] KB1GUE>CQ,RS0ISS,W3ADO-1*,SGATE,WIDE/1:>FN42IL/- CQ from Glenn

[15:56:34] KB2M-5>APRSAT,RS0ISS*,W3ADO-1/1:=3911.01N/07445.00W`www.qsl...
[15:56:35] KB2M-5>APRSAT,RS0ISS,W3ADO-1*/1:=3911.01N/07445.00W`www.qsl...

[15:56:46] WB4APR>APRS,RS0ISS*,W3ADO-1,ARISS/1::ALL      :TEST in
[15:56:47] WB4APR>APRS,RS0ISS,W3ADO-1*,ARISS/1::ALL      :TEST in

[15:57:16] KB2M-5>APRSAT,RS0ISS*,W3ADO-1/1:=3911.01N/07445.00W`www.qsl...
[15:57:16] KB2M-5>APRSAT,RS0ISS,W3ADO-1*/1:=3911.01N/07445.00W`www.qsl...
```

Here is the full text of the successful packets.

```
KB1GVR>    :=4436.18N/06826.92W-> QSL TEST
KB1GUE>    :>FN42IL/- CQ from Glenn in Bedford Mass. - KB1GUE@amsat.org
WB4APR>    ::ALL      :TEST in progress
KB2M-5>    :=3911.01N/07445.00W`www.qsl.net/kb2m
```

Notice that packets went BOTH ways.

One other station, KB1EAA inadvertantly got a Triple hop, but with a ground station inbetween because he had a WIDE on the end of his path (which we have recommended for better IGate success once the packet reaches the ground). But in this case, with ISS also having the WIDE alias, it went back up via satellite!

```
[15:54:19] KB1EAA>APK002,W3ADO-1,SGATE,RS0ISS*/1::PCSAT    :HI{9
```

With the satellites being WIDE also, this is not a good idea (now that I think about it.. sorry)...

For this pass, I got to the ground station after the pass was HALF over and was still able to comand PCsat into power saving mode with the UHF

```
RX's off and the Transmitters isolated.  Thus, PCsat was fully functional
with enough power for the test!

Again, trying not to stray too far off-topic...

But I would also like to point out that several states have statutes that
classify non-contact non-exposure (or consentual acts) "crimes" as sex
offenses and require people convicted under those statutes to register as
sex-offenders even though, psychologically-speaking, they are not sexual
predators.    I find this shameful behavior on the part of legislators,
prosecutors, and police departments that unfairly stigmatizes the
individual and trivializes the severity of the true connotation of the
offense.   I cite Georgia, Arizona, and my neighboring state of Minnesota,
as prime examples.

You hit the nail on the head, AM.  No point in trying to feed 1200b to an
AM tx.  And as such it remails junk.

On the other hand, the new DIGITAL R/C systems use actual digital encoding of the information.

Rendered body type: text/plain

This is a time-corrected list to UTC and it adds N4ZQ that was reported by AZRowe. This is the last analysis I can do tonight without a divorce...

ISS<==>PCSAT SUCCESS:

This was pass of ISS and PCsat over USA with PCsat almost directlly 500 miles overhead of ISS over Newfoundland. To make this fit on your 80 character Email, the first copy is a complete Header with the text truncated and the second list is just the CALL and the DATA part of the successful packets. These times (except for N4ZQ's time) are within 1 sec of UTC.

At 19:56:15 or so, PCsat passed DIRECTLY 420 km over ISS and this was about 100km NW of Natashquan, Quebec. 40 seconds later We got the first successes that lasted one minute. By that time the distance between ISS and PCsat was about 600 km away. The N4ZQ report was using a different clock and I am waiting for confirmation of his clock offset.

Although ISS and PCsat were in view over the entire USA, these succeses occured after most of the USA was no longer in view. The next pass was also directly over USA, but ISS had switched back to voice on 145.800 and so no packet tests were possible. But I did get to talk to Valery (did anyone record it?). This is last analysis I can do, without a divorce. I cant wait to plot everyone and the tracks and put it on the web page...

I'm back from my 31 day road trip, had a wonderful time in Utah. Thanks for those who heard about my broken rib (biking accident before the DCC) and wished me well. It still hurts, and slowed down my biking, kayaking, and hiking vacation a little, but it is healing.

Those at DCC know I was travelling with two commercial trackers as well as VHF APRS. findU provides a nice way to compare the coverage of the three systems. First, APRS (on 144.39, R,W3-3 at 3 min rate):

http://www.findu.com/cgi-bin/track.cgi?call=K4HG-8&geo=usa.geo&start=900

The Earthlink AVL (http://www.research.earthlink.net/avl/) which uses a Motorola Reflex 2-way paging modem transmitting every minute:

http://www.findu.com/cgi-bin/track.cgi?call=avl&geo=usa.geo&start=900

and finally the CAReader system (www.networkcar.com) using a Cingular MobilTex modem transmitting every minute:

http://www.findu.com/cgi-bin/track.cgi?call=careader&geo=usa.geo&start=900

With the exception of I-10 in Louisiana and the Florida panhandle, APRS is the clear winner! Congrats to all who build and maintain the network...not bad for a bunch of amateurs ;-)

For those like me who field the question from non-amateurs "How can I do that without getting a license?", the CAReader is a very nice system. Compact and easy to install (one plug, into the car computer's ODB-II connector), with a ton of features (with telemetry of the car computer's data, and including the ability to use the data to skip smog inspections in California), it is the best commercial solution I've seen.

Steve K4HG

Rendered body type: text/plain

Hi All-
The Weather Service has not co-ordinated the Output of the Amber Alerts between the various offices- The following is from four offices with the same information regarding the vehicle in question:

>From Ft Worth:
THE VEHICLE USED IN THE ABDUCTION IS A WHITE...1999 CHEVROLET...
MODEL Z-71 WITH TEXAS LICENSE PLATE 2JVL01...STANDARD CAB.

>From Houston:
THE VEHICLE USED IN THE ABDUCTION IS A WHITE PICK UP...1999
CHEVROLET...MODEL Z 71...STANDARD CAB. THE TEXAS LICENSE PLATE
IS...2 J V L 61.

>From San Antonio;
THE VEHICLE USED IN THE ABDUCTION IS A WHITE...1999 CHEVROLET...
MODEL Z-71 WITH TEXAS LICENSE PLATE 2JVL01...STANDARD CAB.

>From San Angelo:
THE VEHICLE USED IN THE ABDUCTION IS A WHITE...1999 CHEVROLET...
MODEL Z 71 WITH TEXAS LICENSE PLATE 2 J V L 0 1...STANDARD CAB.

So out of 4 offices there are three ways to say the same thing- this is ok for humans - a major pain trying to write a parser for this stuff- without some help with a standardized format it will not fit into APRS- it is too verbose.

Parse for "LICENSE PLATE" and hope you can back -up to the proper State? Remember if there is this this much variation between NWS offices in one region imagine how much programming it will take for 137 offices. APRS can't be the only situation where the relay of the data needs to be automatic.

There needs to be a clear method of relaying the location if a vehicle or abducted child is seen- remember we have the ability to track a vehicle graphically by gps/aprs. A switch to "Emergency" on a tracker output might work if it could be tied to the Amber Alert.

I will probably have some kind of rudimentary parser going by Monday night - the data is on the EMWIN stream I use for Wx and most of the nuts and bolts are already there.

```
Well, that's the trouble with verbose text entry... it'll never be the
same. If things were coordinated properly, a form with individual fields
for different "normal" characteristics (suspect/victim description, suspect
vehicle, broken down into fields) and a notes field would be wonderful.
Unfortunately, there are probably reasons not to do this too, and trying to
get a governmental organization to put this together may be an impossibility.

Rendered body type: text/plain

```
Given the verbose nature of the Amber Alert messages my suggestion would be
for a "heads up" type of APRS Bulletin.  I see little need to send the
entire thing when it is being broadcast in a massively redundant manner by
the news media.  A simple "check the news" should suffice.

Now if the range circle function in APRS could be harnessed to generate an
expanding circle of probability to show where to look it might be useful
for a brief interval early on. Think 360 dead reckoning.  But it would be
worthless once about 30-45 minutes have passed depending on the speed of
the expansion.

I agree.

Here in Worcester Mass we had a case about a 'registered sex offender'
when the law was passed a while back requiring him to register.

Seems there were some problems with the list!  Some of these guys
even had pistol permits!  Yes, here in the peoples democratic republic
of Mass, one of the two remaining bastions of communism left, after
Bejing and Havana!

But, what was interesting was the court case.  The guy was 'changing'
in his car for a softball game.  A woman walked by and gave him
grief for it, so he intentionally (allegedly) exposed more of his buttocks
than he probably should have.  She grabbed a local officer, and the
guy, instead of taking a stance of 'prove it', evidently thought to smooth
the way and admitted to the officer the whole thing.  Well, the lady was
a "*", pressed the issue, and it goes to court.  Years ago.

Now, when it goes to court, and you have a lady like this pushing the
issue, and you can try to force it but the down side is a possible jail
time.  Or you can plead 'no contest' and pay a $35 fine and end it
there, what would you do?

But...  It didn't end there.  It was 'indecent exposure'.  And years
later, guess what?  He's on the 'sexual offenders' list!

(Just think back to what YOU did in college!)

So, is that fair?

The judge thought not, and now Mass has a '3 tier' sexual offender
list.  Or did the last I looked into it.  (I'm not really one of those who
keeps up with that thing.)

The point is, be careful classifying people just because someone else
'classified' them without knowing the details.

Mike

```
Trying to determine the actual time of abduction would be about impossible
(it MIGHT be contained in the body text, if known). Most amber alerts end
up being deals anyway, and the alert may not go out until hours after the
"abduction."

>
> [15:54:19] KB1EAA>APK002,W3ADO-1,SGATE,RS0ISS*/1::PCSAT    :HI{9
>

Which brings up some questions?
1) Where was the "SGATE" digi?
2) Was it on the ground or ISS?

The "SGATE" path for packets from PCsat or users was invented to solve a
"rules" problem in Australia.  The interpretation I received was that
packets could not be received from space and automatically injected into
a terrestrial network system without the intent of the originator.  THus
by originating packets with the SGATE path in them, then the packets
could be legally picked up and injected into the APRS system.

In that sense, I always thought that most SGATE's were in Australia, or
were only Injecting into the APRS internet, not digipeating back out to
RF.

*OR* since I have been sending the recommendations for this test to ARISS
since January, and I sent many versions and recommendatinos over that
time frame as the status and situation on PCast degraded, I always wanted
them to have the best recommendation.  In some of those, I recommended
that ISS include a digipeating ALIAS of SGATE too.  This way, since all of
PCsat's telemery has SGATE in its path, then if ISS was ever in range of
PCsat, then it might relay PCsat's telemetry.

QUESTION IS, was SGATE installed as a valid ALIAS on ISS?
```

So next time someone has ISS in view and packet is on, try digipeating using the path of UNPROTO CQ VIA SGATE and tell me if it worked. I have confirmed that the aliases of RS0ISS and ARISS and WIDE work, but I didn't check for SGATE. BUT in KB1EAA's packet, the SGATE did not do callsign substitution, so it could not have been ISS. ANd besides, if it HAD digipeated it, then it could not also have digipeated the next hop via RS0ISS too.

Also check for APRSAT. It was recommended as the universal spaceborne UI digipeating alias, but when PCsat started losing its ability to keep its configuration, we were unable to keep that alias maintanied on PCsat, so we removed that from the current recomendatin for this test.. But again, we aren't sure what the 4 active aliases are that actually got loaded on ISS.

Bob

List:

For what it's worth, the Nicole Lightfoot AMBER alert didn't go very well in Austin. Several procedures were skipped or incorrectly processed. The message was not drafted in the proper format so most of the EAS receivers didn't pick it up. Also, by current guidelines, this AMBER alert should never have been posted as it didn't meet the minimum reporting requirement. The child was in the 'possesion?' of one of her parents.

The good news is that she was located. All's well that ends well. The AMBER folks are happy she's home AND that they skated a major faux pas.

Great discussion and Great Ideas.

It looks like the NWS is already issuing these but they are too verbose for an APRS bulletin. In Georgia, we have a system of commercial pagers that the state ARES organization uses to alert county EC's. This system is also tied to the NWS for weather updates in our area. I will contact the person in our state that handles the pagers and see if an Amber Alert would actually go out on our system.

For now, Bob's idea of sending an emergency message may work the best. That message would go out probably nationwide with the internet backbone that APRS is using.

According to the speaker at the meeting I attended, only 2 Amber Alerts were issued in NC last year. He specifically stated that the system is not too be used for parental abduction unless the child's life is in danger. This means that there will not be too many of these alerts occuring, at least in our area.

I think APRS is an excellent medium to use to get this type of word out.

Thanks

I agree with John on this.

All that is needed on the APRS system is a
'heads-up' message to check current news or NWS broadcasts for
Amber Alert information. Transmitting the AMBRALRTn does this w/o
the need for additional information in the APRS message.

A simple message on APRS that will be readable on D-7s
(which have very limited message length);

AMBRALRTn <- fits the callsign length limit of 9 characters, where n
could be used
to track more than one alert occurring at the same time.
This 'callsign'
format for an alert would ensure no conflict with actual
Amateur calls.

01/01 23:59 <- Month/Day Time of report, D-7s don't time stamp
received reports,
and there is a need to know how old the alert is if
you are present
when the report is received by you. Suggest the
Date/Time be placed
in the status line. Could drop the / in date and colon
in time if
line length too long to display properly on D-7.

ICON <- To be determined. Need a standard ICON to be used for
such alerts.

FM28el <- grid square for the alert. since we are looking to watch
an AREA and
not a specific Lat/Lon this would seem to be the shortest
method of
transmitting the watch area IN HUMAN READABLE FORMAT.
Just about everybody
knows what grid square they live in, and with a grid
square map or software
can find nearby or remote (to them) squares. Much easier
to work with grid
squares in my opinion for this application.

CSE/SPD <- Would be included IF a known direction of flight (not as
in flying) were given,
otherwise this would be reported as a FIXED location.

Distance <- No input needed, calculated by the D-7/D-700/or software
based on your
last known position.

Comment <- Short comment, maybe a contact telephone number or vehicle
registration
state and tag number, or a local repeater or net frequency
to QSY to.

I thought about this a month or so ago when the widely published
alerts made the news, but hesitated to post to the SIG. It now seems
others would agree that this would be an appropriate use/application
of APRS.

So before anyone goes and invests a lot of time into how to parse this
information into
APRS, lets agree on what information would be appropriate and a format

to deliver it in that will be usable(readable) by the majority. My
suggestions above may very well not be the best, but they are a start.
If you have something better post to the SIG.

73...Bob, N2IPH
RACES Radio Officer & ARES EC for Cumberland County, NJ

I will throw a monkey wrench in the works:

Is the only alert we may want to worry about is Amber? What about all the
other colors on the spectrum? The proposed message format will have to take
these into account as well, won't they? Or is Amber the only alert the NWS
is going to send?

Thanks,
Chris

Amber is not a color. It is named after a girl Amber that was kidnapped,
raped and murdered.

Before we go too far, we need to remember something..  Most Amber Alerts are
local events.  Statewide alerts (in Texas anyway) are not the norm.  An
Amber Alert is normally activated within a few hours of the child being
missing.  The Alert will be given for a specific area say, 200 mile radius
around Granbury, TX.

I support the idea of APRS being used to notify the APRS comunity of the
existance of an Amber Alert, but not the text of the alert..  A bulletin or
an Announcement can be sent over the network.  How would a person using a
home station (non Kenwood D7, D700, etc) send an emergency announcement?  In
WinAPRS it's not a menu item!

What is the AMBER PLAN?
The AMBER Plan is a voluntary partnership between law enforcement agencies
and the media to send out an emergency alert to the public in serious child
abduction cases. AMBER, which stands for America's Missing: Broadcast
Emergency Response, was
established in 1996 in response to the abduction and murder of nine-year
old Amber Hagerman in Dallas, Texas. Under the AMBER Plan, area radio and
television stations interrupt programming to broadcast information
concerning a serious child abduction case using the Emergency Alert System
(EAS). The goal is the safe recovery of missing children that a law
enforcement agency believes has been abducted and is in danger of serious
harm or death. Missing adults, runaways, and children taken in child
custody disputes usually do not qualify for Amber Plan activation.

For the history of the Amber Plan, see the Arlington TX PD Web Site at
<http://www.arlingtonpd.org/index.asp?nextpg=press/amber.asp>, as well as
the FCC Web Site at <http://www.fcc.gov/cgb/amberalert.html>.

I like this post although I believe it can be simplified.   I would say that the information needed in an Amber Alert exceeds what APRS can offer with in reason.   To be complete you need Time, Location, Personal description of both child and kidnapper, Description of vehicle, Direction of travel, Originating station, and contact source. If you leave out any of these items then you should leave out all but Time, location, originating station, and substitute contact information with Source for more information.   The reason I say this is the fact that even with all the information possible you can still be mislead. And I would hate to be creating a situation where Amateur radio operators are adding to the numbers of false Amber sightings. Ideally it would be great to have an automated system that would use objects for the alert.   But more than likely this info is not available for doing this in a timely fashion. 8(

If the alert message just passed a URL, then we could open the page and get all the details. Dosen't work for D-700's though.

I agree, Roy. I am having a hard time wondering why I would send out
emergency beacons on APRS if I did infact
spot a suspect vehicle. The NWS even though, they sent the alert, are not
the authority to be reporting to.
Let's be real here, folks! if you did receive an alert, and you did spot
the vehicle, possibly with child on board.....would your
reaction be to start sending packets about it? Certainly would not be even

close to my first reactions as a citizen. And, if it's your first dozen or so reactions,,,,well, that just scares the hell out of me for the child's sake.

I would suggest FORGETTING about sending emergency messages and focus your energy on the format of the bulletin, IF the NWS, in an official capacity is going to be sending out these sort of bulletins on APRS. The immediate response you would consider is #1 Self Preservation, #2 Seek Law Enforcement in anyway you can. Until APRS has a full time 24/7 emergency response system with trained personnel, forget it unless it's your last resort.

Hi All-
There are not enough examples of the format used by the NWS for the Amber Alerts to do a very sophisticated parser. I have added Amber parsing to Wxsvr that should detect a test of the system, and possibly send the License Plate and Vehicle Description of a real alert. If you

are mobile, it seems this is the bare minimum you would need to know what to look for- and to know there is an alert in progress.

The format is such that if you are i-gating wx information for your area, add "AMB" to your list of products to send. I.E. "PHIAMB" for Philadelphia. If you have a wildcard enabled gate- you should be set already.

```
PHIAMB>APRS::BLN_AMBER:AMBER:TEST OF THE AMBER ALERT SYSTEM {TEjAA

SJTAMB>APRS::BLN_AMBER:AMBER:A WHITE...1999 CHEVROLET... MODEL Z 71 WITH
TEXAS LICENSE PLATE 2  {942AA

SJTAMB>APRS::BLN_AMBER:AMBER:TEXAS LICENSE PLATE 2 J V L 0 1...STANDARD
CAB.{942AB

HGXAMB>APRS::BLN_AMBER:AMBER:A WHITE PICK UP...1999 CHEVROLET...MODEL Z
71...STANDARD CAB.{9GfAA

HGXAMB>APRS::BLN_AMBER:AMBER:TEXAS LICENSE PLATE IS...2 J V L 61.{9GfAB
```

The AMBER AMBER stutter is for D7's - they won't display the BLN_AMBER.

I hope I have no more bulletins to hone my parsing skills on this one.

Errr, Chris, it isn't a colour, it is the first name of the little girl in TX that got the system started.

Well, actually, she did not start it 'cause she is dead, but it was named after her.

I will throw a monkey wrench in the works:

Is the only alert we may want to worry about is Amber? What about all the other colors on the spectrum? The proposed message format will have to take these into account as well, won't they? Or is Amber the only alert the NWS is going to send?

Thanks,
Chris

Rendered body type: text/plain

On Sun, 13 Oct 2002, Bob D. wrote some good ideas about the amberalert. and it triggered these thoughts:

The Mic-E format for EMERGENCY is the only curent APRS format that actually triggers alarms. We have talked about other formats, but were never able to get the different authors to agree. So I just realized that there is nothing that prohibits any PC from generating an EMERGENCY in Mic-E format when needed. duh... We have the definition, it DOES trigger alarms in all software, so if one needs to use it, then do it.

Thus the GENERAL method in all of APRSdom to generate a CANNOT-IGNORE type of alert is witht he Mic-E EMEREGENCY format. Then you have 20 characters of STATUS text in which to tell what KIND of alert. Usually, this tells you to look for a BULLETIN of the same subject.

So choose exactly what you can fit into those 20 characters. But also remember that the new G model kenwood also uses up some of those characters for altitude, so you can only guarantee I think 17 characters. My first guess at a format would be "AMBER-MD13/1420" showing the TYPE of emergency, the State, and the DATE and TIME.

Everything else goes in a bulletin. This general format can be used for any other kind of alerting process in APRS as well. But the text MUST be limited to 20 bytes (or 17, we need to determine that for sure.)

Actually, the limitation of 17 would only apply if the EMERGENCY STAtus was entered on a "G" model D7 AND if that D7 was curently in GPS mode with a valide GPS stream. Only then is altitude present. And then the question is, WHAT does a NON-G model see? That is when the truncatin ot 17 characters may appear. So if we do standardize on 20 characters, make sure that the LAST 3 characters (if uses) are NOT CRITICAL...

Thanks for clarifying the situation for me. I was taking this thread another way and applying it to the National Home Defense Department's code for national readiness. I forgot the actual acronym for it, but they use a color scheme for several levels of alert readiness. I was looking for all colors to be included in the packet format.

Rendered body type: text/plain

More on the joint ISS/PCsat joint test:

Although the fun part of the joint ISS/PCsat test was the attempt to demonstrate dual satellite constellation opportunities for double hops, the more subtle advantage that many people may have overlooked is the double access times.

On Friday evening when ISS first came onto 145.825 and while it was 180 degrees out of phase with PCsat, those people sitting on 145.825 were greeted with almost 10 hours straight of almost 14 satellite passes averaging every 45 minutes or so. It was a busy night. Seems like I couldnt get anything much done, because there was always another pass just coming up, or just having ended.

Thus with only 2 satellites flying in constellation on the same frequency with the same generic UI digipeating mission, we were getting a sample of what I hope to show as the future of UI digipeating in space. That is, if we can get some of those contemplating the construction of a LEO satelltie to include a UI digiepater on 145.825, then we would have an amateur radio satellite system capable of on average providing communications support to mobiles and handheld operators anywhere on the planet at least once every 15 minutes or so around the clock.

Although this joint-generic access portion of this test, was one of the fundamental objectives when we first proposed it back in January 2002, that aspect was significantly compromised when PCsat began operating in negative power budget and in the later months could no longer remember its settings and so we could not get ISS and PCsat to use the SAME generic "WIDE" alias. Thus each user did have to change his UNPROTO path between satellties.

But imagine if they were both "WIDE", then the 10 hours of more than 14 combined passes in one evening of keyboard QSO's independent of whichever satellite was actually in view should have been quite impressive.

Robbie asked:

>Can someone please describe changing unproto paths using Winaprs
>and AGWPE? I have them working together, and when going to
>Settings/TNC and change my path, it stays the same, WIDE,WIDE and
>I don't think that works on HF

You need to edit (with Notepad, for example) the appropriate *.prt file in
the PORTS folder under the main WinAPRS folder. For example, my AGWPE port
file is named AGWPE_Local.prt (yours could be different).

In it is a line:

```
PATH    WIDE,WIDE
```

So change that line to the PATH of your choice, save the file, and restart
WinAPRS.

Note that the space after the word PATH is created by the TAB key, not the
space bar.

Is it possible with the latest version of WinAPRS to use longer paths
than the 16 character limit? I remember that in the past I could never
enter a path of two 2x3 callsigns with SSIDs.

Thanks and 73,

As far as I know, that limit wasn't changed in 2.6.1.

Perhaps someone running 2.6.1 could verify that. I haven't upgraded yet.

226. [aprssig] Re: [amsat-bb] 2 x Soundcards in PC

From: Bob Bruninga <bruninga@usna.edu>
Date: Mon, 14 Oct 2002 12:39:44 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: amsat-bb@AMSAT.Org
Message-ID: <LYR842-102724-2002.10.14-12.22.18--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Concerning how to do two soundcards in one PC,

Dont forget that with just 8 resistors feeding an audio amp, on the LPT1
Parallel port of ANY ole' pc, you can get 8 bit fidelity by sending 8bit
WAV files out the LPT1 port.

I use this for generating speech for simple dos programs. The following
BASIC program will send out an 8bit mono WAVE file is only 8 lines:

```
-------------------------------------------------------------
 N=2                       'adjust N for the speed of your PC.
                           'N =2 works for my 25 MHz laptop
 OPEN "xxx.wav" FOR INPUT AS #1
 DO UNTIL EOF(1)
    A$=INPUT$(1,1)
    OUT 888, ASC(A$)
    FOR J = 1 to N: NEXT
 LOOP                     'actually it should not start outputting data
 CLOSE                    'until the 60th byte, but out of 8000 bytes a
 END                      'second, the added code is not worth destroying
                          'the simplicity of this example.
-------------------------------------------------------------------
```

No this will not meet the original posters needs, but if you only need
a second card for OUTPUT only, then this might help...

I use this with my APRStt TOUCH-TONE system so that APRStt can speak back
to the DTMF user with an HT, any APRS data he needs to know.

227. [aprssig] Alaska and Pacific Northwest ISS/PCsat

From: Bob Bruninga <bruninga@usna.edu>
Date: Mon, 14 Oct 2002 13:02:10 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-102725-2002.10.14-12.44.43--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This evening is a great opportunity for hams in Alaska and the Pcacific
Northwest to do a double-hop (or triple hop test) between ISS and PCsat
(if ISS is over on 145.825).

At about 0320z (is that 8 PM seatle time?) Iss will just come into view
over the pacific and PCsat will be just behind. A lucky Alaska or seattle
UI packet could use an RS0ISS,W3ADO-1,RS0ISS path and possibly make a
triple hop back to the sender.

This will work best right at the start of the pass before ISS hear's much
of the USA and before the QRM gets too much. Also PCsat will be in full
sun and fully charged.

There have been several of these oportunities over this weekend around the
world but I am not at our ground station, so I don't know if ISS is still
over on 145.825 for the test or not. I havent seen anything here on the
BB... other than the Saturday nith successes.

UPDATE YOUR KEPS. The ISS has done one of its reboosts and your
predictions may be a few miuntes off. (MINE ABOVE were using OLD keps, so

dont trust them. VERIFY.

I can definitely confirm that ISS was on 145.825 when it went over Idaho
about 15 minutes ago.

Bill

There are many,many more. I was only looking for USA opportunities.
Three are many opportunities every day over other countries. And coutries
far from Europe and USA will have better luck too.

People in other countries should look at all passes in their areas during
these windows. There are many, many opportunities in countries besides
USA and Europe... Run your tracking program to the OPENING time and then
let it fast forward until PCsat or ISS is in range of your station. That
is how to find opportunities.

I havent logged much any activity on my ISS radio for several days. How long will ISS be off of the standard frequency. Do I need to move my radio?

This is not an easy task, it is one of those lovely kenwood tm241a's with the lousy display engineering. (I have 2 of them) both with dead display's and any time I have to move the frequency I have to get a frequency counter out and play around for 10 minutes sometimes getting a new frequency set.

I am looking for a point of contact for the Tucson IGate (KV4OA). I have tried contacting the listed sysop (N7CK), but have not received a response. The IGate is no longer properly configured for two-way data exchange with the core servers. Would someone affiliated with this IGate please contact me directly.

Thanks,

Greg

Howdy,

We have a digipeater on 145.175 MHz. (fixed for mobile traffic)

What would be the easiest way to add recieve capability for 145.825 and 145.800 ?

1. Double jumper the audio and hope they never clash
2. Isolate 145.175 Mhz audio when a sat comes up
3. Run a seperate TNC and have RS232 sharing
4. Use the DCD to stop rs232 clashes ?
5. buffer rs232 and insert data between tnc's ?

What is common about iss and pcsat ? is it "SATGATE" ?

Thoughts ?

Use a basic stamp to assert CTS on two TNCs.... When RTS goes high on one of them, unassert it's CTS line, and monitor for a lapse in activity on the TX data line (pulse in, right? no need for serial in). When the TX serial line has been dormant for say, 1 second, assume the packet is finished and reassert the CTS line. You could multiplex many many TNCs like this... and could use a basic stamp 1, because you don't have to read the actual serial data... just the logic level of the data line.

Why?  Every mobile will hear the satelltie sig just as well if not better
than the digi (They have less  coax loss).  But I guess you want it so
that they dont even need to know when it is in view...  good idea...

> > 1. Double jumper the audio and hope they never clash

Depends on how busy is your 145.175 network.

> 2. Isolate 145.175 Mhz audio when a sat comes up
> 3. Run a seperate TNC and have RS232 sharing

This works great.  Set both TNC terminal rates to 9600 baud or higher to
mimnimize collisions.

> What is common about iss and pcsat ? is it "SATGATE" ?

Nothing.  PCsat supports ARISS when it can remember its settings, but it
cant..

Well, yes, it was, Eric...

Besides that, Doug got a response befittin' his reply to
me.   I was gently tellin' him that I did not
appreciate it.

This is a reflector and if messageds don't go to
the reflector, the other members miss stuff.
I'm a firm believer in that!

If anyone is interested, I just posted an APRStk screen shot of the joint
ISS/PCsat test pass on Saturday when 5 stations were successful with dual
hops. See the PCsat web page below.

It shows where the stations and Spacecraft were at the times of the
successful packets. It also shows everyone else that we saw during that
pass.

I've had a request to post satellite data over our club's local APRS digi.
However, the digi (VE3KSR) is simply a KPC3+ and weather station in a
fairly difficult to access location (for me anyway - 30km away on top of a
broadcast transmitter hill, and I don't have the keys).

However, I also run a local aprsd gateway to reliably get my WX packets to a web page via a DSL link. Is there any Linux-based software that will keep up-to-date with satellite keps over the net and localize them so I can send them to the digi for a one-hop beacon?

If there is nothing off-the-shelf, I would consider writing something myself if someone would give me pointers to the kep-localization algorithm I would need and the format I would need to send to my aprsd server.

Use a basic stamp to assert CTS on two TNCs.... When RTS goes high on one of them, unassert it's CTS line, and monitor for a lapse in activity on the TX data line (pulse in, right? no need for serial in). When the TX serial line has been dormant for say, 1 second, assume the packet is finished and reassert the CTS line. You could multiplex many many TNCs like this... and could use a basic stamp 1, because you don't have to read the actual serial data... just the logic level of the data line.

Are you wanting to transmit current satellite positions, or the keplerian data so that others can compute the positions themselves?

If you just want to send the kepler data for a few sats, you can probably write something quickly using shell scripts or Perl that uses "wget" to go snag the latest keps from some ftp or http site, then parse through that to get the lines you want. I'm not sure if there's an APRS message format that would handle the keps, in particular the length of the data.

If you want to send satellite positions There are several Linux programs that can predict positions. Predict is one.

    http://www.qsl.net/kd2bd/predict.html

There are others. Perhaps you could snag the base code that does the predictions and use it directly without the GUI portion in order to get the text data you need.

Try these places also for other satellite programs:

    http://radio.linux.org.au/
    http://freshmeat.net/
    http://sourceforge.net

My APRStk sends and receives NASA one-line keps over the air in a single
packet to update everyone on frequency.  I invented one of the
experimental formats for it as shown below:

HEADER  AUTHOR   DESCRIPTION
------  -------- ----------------------------------------------------
 {Fnn   WB4APR   nn is a 2 byte descriptor of MITEL GPS data formats
 {K1    WB4APR   "K" for Keps and "1" for NASA One line.
 {K2n   WB4APR   For NASA two line elements. "n" is line 1 or 2.

Though I see little value for it on an already overcrowded APRS system
where everyone has access to the internet.  I only proposed the system for
if we ever get to the point of mobile rigs having to do their own
satellite predictions...  for routine ops (not mobiles) I see no need for
keps over the air...

just a thought...

I believe that this kind of petty bicking over typed words and hurried
responses only serves to provide a way for Type-A personalities to assert
their supperiority over others by picking and picking until the other party
stops responding.  I bet that this email won't be the last on this topic, as I
can sense that folks are still not convinced that they've won a prize worth
stopping for...

Rendered body type: text/plain

The W2AAA-1 digipeater has been taken out of APRS service and QSY'd to the BEACONet.25 frequency of 147.585 MHz FM. I am interested in reception reports on this quiet frequency.

Tune 147.585 and park for a while. It will ID every 10 minutes. Please note it's strength at your location (hopefully identified by 6-character grid square), and type of equipment you have.

This weekend, I hope to move it to it's new location (much higher, but possibly tucked into a "mountain cove"). I'd like to run the tests again then (I'll let you know when it happens so a good comparison can be run).

Please send reports direct to me.

Thank you sincerely for your help.

Regards,
Ev Tupis, W2EV

ps...yes, I know how non-scientific this is...but I won't lose sleep over it if you don't. :o))

253. [aprssig] RE: Amber alert suggestion

From: "Bob D." <n2iph@comcast.net>
Date: Wed, 16 Oct 2002 05:38:59 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-102999-2002.10.16-05.21.42--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Well. I am glad to see my suggestion has sparked some discussion,
but I think some/part of my suggestion has been misinterpreted.

No mention of Amateurs making reports of sightings via packet or
APRS was made by me, the alert message is to notify those in the
field (that's everyone, everywhere)that an Amber Alert has been
issued and to go get the full story (alert message) from some
other source (internet, radio, TV, etc.). The full text nor
many details could be jammed into an APRS message, only enough
to let you know there is an alert in your area.

In my opinion only one agency/group/authority should be sending
such an alert out in a given area, not anyone who happens to see
or hear of an alert on the News or through some other means, this
would be chaos. I doubt the NWS has the time to format an APRS
message and send it out, this is an area that requires further
discussion. Some entity such as an Official Bulletin Station, a
State, Region, or County RACES RO, or ARES Section SEC may be a
good choice. Whoever has this duty (which might be rotated through
a number of individuals) would have to have the capability to issue
the message on APRS in a timely fashion.

Maybe re-using the NWS WX alerting zones as the alerting areas
would work for us. Don't know if the NWS uses this method to
target their passing of these messages or not, but sounds plausible.
Your WX radio is already programmed for your WX warning zone(s),
provided you have one of the newer WX radios. Using these same zone
areas for the APRS alert might work too, but overall for APRS I like
the grid sq. or ambiguous posit reporting method better. This is a
format that would/could be parsed to my GPS so I now would have a
waypoint appear on my GPS display (I am figuring I'm mobile for this
example) and could immediately ascertain my position relationship to
the alert area.

OK but those in the field do not have internet or TV necessarily - kind of defeats the purpose of sending an aprs message. I actually think an alert by aprs with details available via SMS messaging makes more sense.

This is much better done automatically- setting up an entire structure for something that only happens twice a year is a waste of resources. I am already parsing enough information to know there is an alert in progress on a server that is up at least 99% of the time.

The alerts are sent by individual NWS offices- and should be i-gated only for those areas. If you are mobile and receive an alert, you know it is somewhat in your area and be on the lookout. (BOLO). On the WX radio- if you told it to react to CEM (Civil Emergency Message) you would hear it- but the NWS is going to change the code later to its own type, so it will be a few years before this is universal.

Those packets were originated by me, for that one day test the other night and apparently I still have a rig somewhere with that callsign. I think I know which one it is, so Ill put the callsign back to real amateur call tonight...

THanks for the heads up.

It is in Beta testing right now.  Seems like it is going to work!

Rendered body type: text/plain

Hi,

Can someone please give me an example of a position beacon using a
radio, tnc, and a laptop? I know if I searched long enough I could
find it, but a friend is taking off for Florida and wants to send
his position obtained from a GPS occasionally..

Sure appreciate it..

Robbie, wa9inf

If he's going to send manual positions, he can either use the
straight GPS NMEA string format, or one of the more filtered APRS
position formats.

On the tapr.org site is the APRS spec in PDF format. That has all
of your answers, including examples of most of the types of packets.

WXTrak is a new firmware for the TinyTrak which interfaces to weather
stations and sends APRS format weather beacons. It currently
supports Radio Shack WX200, Oregon Scientific WM918, and Peet (U2K,
etc.). Dallas 1-wire and Davis are next on the support list. It is
currently in beta test, and I expect the first release to be in about
4-6 weeks. When it is available, details will be posted to both this
list, and to www.byonics.com

If his GPS displays Grid Squares (Garmins do), then just put [GG##gg]...
in his beacon text and set his beacon to once every 5 minutes or so..

Rendered body type: text/plain

An alias is a name assigned to a packet station
(often indicatin' the location of the station).

In our system , for example, we have W4RAL-4 CLAYNC.
CLAYNC is the alias and the node is in Clayton, North Carolina.

Subject: [aprssig] Alias?

Hello Group,
What is an alias? I have been looking at the aprs program and wanted to
knpow what it is used for. Can soneone help me out?
Thanks

```
I've got a homebuilt tracker that I'm not using, so I'm looking to sell it off.

It's built around a KPC-3 v6.0 and an MFJ Dataradio. I've put together a
web page that shows it off at http://www.dnaco.net/~preed/tracker.html
where you can see all the construction details. It will include a 2m
mag-mount antenna.

Please contact me off-list to discuss pricing if you're interested.

It should be noted that the "alias" is a callsign that the digipeater
will also recognize as something it should digipeat and it will then do
callsign substitution so you konw what call actually used that alias...

269. [aprssig] Alias question answered, but a few new ones.

From: "Peter \"Dakota\" Summerhawk" <Dakotas@dotorg.org>
Date: Wed, 16 Oct 2002 19:56:59 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-103124-2002.10.16-21.40.21--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

OK so I now have a idea from all of the helpful emails from everybody (and I thank everyone) I now am faced with another question. The program I am using has a space for My alias and a space for Digipeater path. So the Digi path is filled out with relay,wide5-5 to be able to hit the local did which is a good 40 miles away does the alias need to be filled out as well? I am trying to fall within the guidelines of the APRS community.
Thanks

I have for sale a Garmin StreetPilot ColorMap with a 64 MB data card. It was purchased new at Dayton this year. Just like new. In perfect condition. Comes with 2 dash mounts, cigarette lighter adapter, PC interface cable and manual. Asking $425 shipped in the US.
Thanks, Jim W9UUM

271. [aprssig] Schematic of remote battery sensing w/KPC-3 using the analog input?

From: "Kriss Alan Kliegle" <kliegle@rcn.com>
Date: Thu, 17 Oct 2002 6:38:35
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-103177-2002.10.17-07.21.10--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Greetings from NH.
My solar powered digi went down due to too much use. (go figure!)
Does anyone have the schematic of remotely sensing battery voltage at the site using the analog inputs of a KPC-3 ver 8.2???? Then I could remotely turn off the WIDE or RELAY portion of the digi, eliminating 90% of traffic when battery gets low.
Thanks!

Kriss KA1GJU
EC East Rockingham CO

You may want to use a uidigi tnc which has a little more efficient algorithm's for reducing packet clutter. It may reduce transmissions by a considerable amount of re-transmits not being sent... I would look into the mfj 1270/uidigi as I suspect you could lower overall consumption and fix the real problem....

Use a pair of resistors... 10k and 24k I think.... outlined in the DOS aprs documentation. I'm using this on a KPC3 in my wife's car... telemetry sends

```
the voltage x 10.... 124 = 12.4volts , 138 = 13.8 volts.  Works like a
champ.

Wes

I have a Garmin III+ GPS in like new condition. The unit includes the
original box, manual , pc cable and all documentation. It has had little use
and is a perfect unit for APRS applications as it does NMEA both in and out.
Asking $175 shipped to your home in CONUS. If interested please email me
directly at mmalloy@wi.rr.com.

It's too bad that most APRS software doesn't handle this telemetry very
well.  My wish list includes customizable telemetry displays based on
callsign.

That is built into the protocol.  The labels, units and telemetry
equations can be transmitted over the air.  This makes for a custom
display for everyone that receives it.

Or maybe you are pointing out that the customized-over-the-air function
does not distinguish callsign in APRSdos.  This is true.  But the
application we desigend for was the typical balloon launch where everyone
(for that event) is only interested in one telemetry format.

I have not considered the multi-callsign/multi-customization in APRSdos
because it takes more memory.  But the APRS protocol can certainly handle
it, because the customization is assigned by callsign...

No.  Steve changed the page to reduce the loading on Mapblast's server to
lessen the chance that Mapblast will cut off out freebie access to the server
entirely.

without telling us what program you're using and the application, i.e. home
station (assumed), server, etc. ... you're getting info about the different
parts of the elephant :{D

I'll guess you're using WinAPRS. If memory serves correctly you'll likely
want to place RELAY in the area for ALIAS. You may also choose to not put
anything in there in which case your station will not act as a relay for
others that put RELAY in their path statements.

WIDE5-5 will take your signal _through_ FIVE wide area digipeaters. If there
is no station between you and said digi 40 miles away, WIDE5-5 will not
magically get it there, this is as you've noted a _path_, which means via or
through X number of WIDE type digis. If distance is your concern you'll
probably need a decent antenna and maybe 10w of power or a bit more. I used
to work connected packet over 40 nm with a decent omni that had about 6 dbi
gain (stated), power was at different times 45, 25 and 5 watts, mostly 25
from a converted crystal controlled marine radio.

As always, I stand to be corrected. Your local guidelines may vary.

If you're running it on Linux, Xastir along with the wx200d daemon
will handle that particular weather station.

If you're running digi_ned on DOS, I can't help you.

See http://www.eskimo.com/~archer/xastir.html to read about what
weather stations/maps/TNC's Xastir will handle.

Hi there,

Mark, W4CHL, and the Phillips ARC started a very interesting project using APRS devices for ARES purposes in environments such as shelters. See:

http://www.rtpnet.org/phpBB2/viewtopic.php?t=57

He asked me if it was possible to send NTS radiograms using APRS. The APRS specs on page 75 describe the message format to transport a NTS radiogram on APRS.

What I was wondering about is if someone had success utilizing this feature?

Since a radiogram consist of at least 5 or 6 regular messages, it seems to me that the effectiveness of such a radiogram would be very much compromised in a typical RF APRS environment. Since delivery can not be guaranteed, would it even be worth while to implement such a feature in APRS client software?

Thank you and 73,

Hi all,

I need your expertise. We are reinstalling our APRS system at our local NWS office and they have moved us to a differnet computer. It is a Dell running MS2000. I don't have any experience running Dos APRS on that system. Have any of you operated on that system and is there anything I should know about installing the program.

Your assistance is much appreciated from snowy Fairbanks.

I'm not sure what you need, but WinAPRS has NTS Radiogram function built in,
The radiogram is in a fill in the blanks format.

I have been playing around with the radio gram sending of a earlier version
of WINAPRS and I have not got it to work. But then again I am sending the
messages from WINAPRS to APRS CE. I might try to run it from a laptop hooked
in to the net and the desktop with the TNC run in to it. I will try to get
this done this weekend and let everyone know the results.
Keep you posted.

The ONLY purpose of NTS radiogramms implementation in APRS was for the
"last-mile" end user delivery. That is, someone has NTS traffic for Joe,
and the sender has a DIRECT path to joe. Then the APRS NTS capability can
be used to deliver to joe that simple few line message.

Notice this is a "last-mile" delivery convenience. *** There was never
any intent for the long-haul delivery of NTS traffic or radiograms in
APRS.**** FOr anything but direct on a non-saturated channel, NTS
messages should never even be attempted on APRS.

We've used it quite a bit. Works best peer-to-peer. Long haul is a bit
difficult unless your on HF...

Subject: [aprssig] NTS radiogram

Hi there,

Mark, W4CHL, and the Phillips ARC started a very interesting project
using APRS devices for ARES purposes in environments such as shelters.
See:

http://www.rtpnet.org/phpBB2/viewtopic.php?t=57

He asked me if it was possible to send NTS radiograms using APRS. The
APRS specs on page 75 describe the message format to transport a NTS
radiogram on APRS.

What I was wondering about is if someone had success utilizing this
feature?

Since a radiogram consist of at least 5 or 6 regular messages, it seems
to me that the effectiveness of such a radiogram would be very much
compromised in a typical RF APRS environment. Since delivery can not be
guaranteed, would it even be worth while to implement such a feature in
APRS client software?

Thank you and 73,

Bob,
Can the APRS network be used to send the NTS in the form of email? Or is
that overloading the system as well? I know that the documentation is for
short messages but id the format to log?
let me know.

But the current SOFTWARE (Windows) doesn't really do anything with the
telemetry. Now WinAPRS has a graph function, but all it gives you is a
graph.   It would like to be able to say:

Make telemetry channel 1 voltage and label it thus.   Make telemetry
channel 1 display as an analog like volt-meter with a high of 15 volts and
a low of 5 volts.

Marke telemetry channel 2 temperature and label it thus. Make telemetry
channel 2 display as a analog bar graph (analog thermometer) with a high of
120 degrees (F) and and low of -5 degrees (F)

I would also like a manual calibration function so that slight variables
can be taken care of in software.

APRS has the form built in to it.
Hit N to see NTS and ALT N to send NTS.

I've used it. It is ACK'ed just like a one-liner.

So y'all will know whether it got there.

The ad states no OS, no drivers, no floppy. I just got off of the phone with Fujitsu. They can reimage the drive starting at $150.00 to include Win 95 and their pen-x software. There are no provisions to backup the drive to a floppy or other media. The FDD is propritory.

A good deal if you can use it. Too bad there is no OS.

I just ran a test using WinAPRS. I sent 3 test messages. The first two I aborted as they were not being ack'ed. The third message was received by the intended station. He got it as a series of one line messages. When we looked in the NTS section of WinAPRS, he had received ALL three messages that I had sent. It seems then that WinAPRS will log ANY NTS message that it hears, that is sent via the WinAPRS format, which I assume is the proper NTS format, as the Log shows a completed NTS Radiogram. In my test, both stations were using WinAPRS. Hope this helps.

No, unless you have a clear channel on a different frequency,..  APRS is
designed to get single packets of information to ALMOST everyone
efficiently.  It is not good at getting multiple packets to ONE station
reliably if they must arrive in-order and without omission...

Have  you tried sending it the 4 telemetry customization packets over the
air?  There are 4 packets that can be sent as a MSG or as a BULLETIN that
should cause all telemetry screens to show the correct LABELS, UNITS,
EQUATIONS and SCREEN LABEL.  Maybe WinAPRS never iimplemented this?

Its been in APRSdos since the mid 1995 time frame...

303. [aprssig] APRS Internet Servers

From: "Phil Pacier, AD6NH" <ad6nh@arrl.net>
Date: Thu, 17 Oct 2002 16:3:42
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-103269-2002.10.17-16.46.26--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
The following is a snip from a post I originally made on the UIView sig.
It is in regards to APRS Internet Server port standardization.  While I
```

realize that port standardization may not be possible given the scope of
the APRS IS, I have decided to give it a try. This is based on my 1.5
years as an APRS Server sysop, and there may be conflicts with your own
ideas. I welcome any comments!

Just for information purposes, here are a few general port
identifications:

10152 = world feed, full bi-directional (all servers)
10151 = world feed, full bi-directional w/30min dump (most servers)
1314 = world feed, bi-directional messages only (most servers)
14579 = regional feeds, full bi-directional (region according to
server location, i.e. aprsca.net:14579 is California,
aprswest.net:14579 is West US, etc.)
14580 = regional feeds, bi-directional messages only
23 = Core Server port OR CW/WX data only! **If you are not a CW/WX
station sending periodic data to the inter net, do not use port 23
except for connecting to the core servers! Use 10152 indstead**
10150 = Uni-directional SatGate port (available on aprsca.net only).
This port is for client > server feeding of SatGated data. No data is
sent back to the connected client. Useful for reducing bandwidth at
home stations that already have a main APRS computer.
2023 = This port is still in use on some systems for full feed
(ahubswe.net) but is being phased out as a main APRS port. New uses
for port 2023 include Non-Standard APRS networks. If you are
currently using 2023 to connect to a regular APRS port, please change
to 10152 ASAP to avoid loss of data.

Some servers that follow this config:
aprsca.net
aprswest.net
ahubeast.net

Check Roger Bille's stats page for more servers
http://www.ahubswe.net/aprs_stat.asp

Check individual pages for more information regarding local ports
(i.e. www.aprsca.net, www.aprswest.net, etc.)

Thanks, and 73
Phil Pacier - AD6NH

Change that to "Linux/Solaris/BSD/Mac OS X/S390 machine"! hi hi

On Fri, 18 Oct 2002, Andrew Rich wrote:

> 1. xhost + (on local machine)

Ummmm... That take's away all security on your X-display. Better
would be to type:

```
    xhost machinename
```

so that only the remote machine you're dealing with can write to the
display. This prevents _most_ people from snooping on your
X-display or starting up programs on it that you don't want.
Depends on how much security you require. If you have multiple
users on the machine you're connecting from, this still isn't enough
security.

> 2. telnet 172.93.1.100 (box with xastir on it)
> 3. DISPLAY=172.93.1.128:0.0 (our display)
> 4. export DISPLAY

These three steps can be simplified greatly if you're running SSH and SSHD. Just type:

```
     ssh 172.93.1.100
```

It'll log you in and set your display variable for you. One stop shopping! Of course you have to set up each machine properly first for SSH but it'll save you time later.

You can also run ssh-agent to simplify things/speed things up, particularly if you also chose a passphrase to go along with your public/private SSH keys. ssh-agent will supply that passphrase to each SSH connection automatically.

> 5. xastir &

The revised method for security/ease-of-use would be:

```
  1. xhost remotemachinename
  2. ssh 172.93.1.100 (or ssh hostname)
  3. xastir &
```

I use a similar method to start up more than one copy of Xastir on one box:

```
  1. xhost localhost
  2. su newusername
  3. xastir &
```

As long as you're not trying to talk directly to the same serial ports, multiple copies of Xastir run as different users can co-exist, and they pull from the same map directories. They can share the same AX.25 kernel interfaces and connect to the same internet feeds.

Fun stuff, this free software, isn't it?

I spent some time recently "playing" with telemetry decoding, and wrote a plug-in for UI-View32 that allows full manual configuration of

telemetry decoding on a per-callsign basis. It also captures any
"BITS.", "PARM.", "UNIT." and "EQNS." messages it sees, so fully
automatic configuration of the various decoding parameters is possible.

Over a weekend, I found more than 50 stations transmitting telemetry,
and only about six stations transmitting decoding information in
messages, most of which were complete junk. In some cases, I doubt if
the operators concerned knew they were transmitting the messages,
because they weren't transmitting any telemetry.

In the end I had precisely two telemetry transmissions I could decode -
one from a digi in the USA for which I knew the equations, etc, so I
could configure it manually, and the other from a KPC-3 digi in the UK,
where the operator kindly responded to my request to put the decoding
information messages in the LT buffers.

I finished up so unenthusiastic, that, other than for giving the plug-in
to a few users to test, I couldn't even be bothered to release it!

306. [aprssig] Speed bug in the D7A

From: "Byon Garrabrant" <byon@byon.com>
Date: Thu, 17 Oct 2002 14:24:02 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-103273-2002.10.17-17.06.37--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The last time I went flying with some friends, I took along a
TinyTrakII and my D7A, and I noticed that the speed displayed on the
D7A was wrong. I assumed it was a bug in the TinyTrakII when the
speed was greater than 100.

I just tested this again and found that in APRS text mode everything
works fine, but in MIC-E mode, it appears that the hundreds digit is
ignored. I pasted the TinyTrakII generated packet into APRSDECD, and
the data looks good. So I think the D7A, and perhaps even the D700,
has a bug that ignores the hundred digit of the speed in MIC-E format
packets.

Can anyone confirm this? Is it a known problem?

Thanks,
Byon

VNC may be an option as well... as with any remote graphical access,
your mileage may very depending on your available bandwidth.

Chuck, KG4IJB

I would avoid buying the Fujitsu Stylistic 500's... Especially when you can Pick up a 1200 (or 2300) for not much more.   I got my Stylistic 1200 WITH a docking station for I think $122.00 total.

If you dig around on the Internet, you can find ALL the drivers for the various Fujitsu pentabs, even the screen-rotate software.   If you buy a 1200 I have all the drivers on a hard drive somewhere...

Furthermore, no OS and no floppy is NO PROBLEM.   Go down to your local screwdriver shop and buy a $5.95 3.5-to-2.5 inch hard drive adapter. Pop the drive out of the Fuj' and put it in a desktop computer.   It might even be time to put in a larger hard drive, just be aware of BIOS/OS drive limitations and drive maximum thickness... At this point I would write zeros to the drive and test it (get GWSCAN from Gateway's web site).   FDISK & Reformat the drive (maybe even sys it) and copy Win95 or Win98 cabs on the 2.5 inch hard drive. (don't put Win98 on a Stylistic 500 unless you want a DOG SLOW system).

You'll probably need some sort of NIC (like a PCMCIA NIC) to get additional software on the system (or a parallel port floppy or CD ROM).   Install that driver now too. If you're installing Win98 and the Fuj has IRDA and you have another computer or Pocket PC with IRDA, you can forgo this and send additional software or drivers initially via IRDA.   I have a PCMCIA and USB ethernet adapter for my 1200, but most of the time I use an 802.11b ORiNOCO Gold Card on this system.   Wireless is the way to go.

Put the drive back in the Fujitsu and run setup.   You're in business.   It really is easier than it sounds, and you'll have acquired a useful skill.   I know people who are MCSE and CNA/CNE certified (MIS Grad Students) who can not FDISK and Format a hard drive... As long as that is the case, I'll always have a job. :)

It's too bad the Fujitsus don't have a boot to PCMCIA drive as a BIOS option, or it'd be a much easier task...

73,

Mark

Or!
1. ssh 172.93.1.100
2. xastir &

Not only more secure but easier.  This, of course, assumes SSH is setup
for tunneling properly on both systems. (Works by default on all my
Redhat systems.  Even with Windows as the DISPLAY machine using Putty &
Exceed. :-)

Oops.  The post from David Norris reminded me that step 1) is not
needed either with SSH.

Thanks for the effort. It is amazing to me that every KPC-3+, MIM module and Mic-E on the air has the potential for sending 5 channels of routine analog telemetry and yet so few hams use it. I think it is because WinAPRS never fully implemented telemetry decoding and so most of the newcomers to APRS have no idea of its potential.

But as UIview grows and those people who still use APRSdos and have seen telemetry, I hope to see more use of it. SUNSAT and PCsat and STARSHINE satellites all used APRS telemetry format and we have 3 more satellites in work that will use it..

Thanks...
Bob

Dear Curt,

On behalf of my friend SV8BUR and myself, thanks so much for your help. I believe Periklis will be able to resolve his problem with your pointer. He has just migrated from W98 to Linux!!!

Can someone help me with maps for WinAPRS? I need any for Michigan, Great
Lakes area, Ohio, Indiana, Illinois, Wisconsin, Ontario, etc. The Sproul's
Rutgers site is not accessable or I am having trouble getting to it. Can
someone send me the URL if they can get to it? TAPR doesn't seem to have
the maps I am looking for.

Thanks in advance,

Chris

There's at least 3-4 stations in the area that use it. One is a 100%
solar-powered repeater site that is inaccessible all winter long. They
transmit battery and charge voltage and use the telemetry to monitor
trends. If conditions get bad enough they can drop about 95% of the load
via the repeater controller. It works very well for that.

I think the question is (or at least it's the question I was trying to
address) - How much decoding of telemetry can telemetry users reasonably
expect to see in APRS clients, when, by not transmitting the decoding
information, their telemetry will forever remain a mystery to everyone
except themselves?

A quick look at my system shows that I have received telemetry from 49
different callsigns in the past 24 hours (all via the internet). In the
past two weeks I have received decoding information, in messages
formatted according to the APRS spec, from precisely nine stations, and
nearly all of it is junk. The result is that, relying on "off-air"
decoding information, I can decode the telemetry from *one* station, and
that's the digi where I asked the operator if he could start
transmitting the decoding information messages.

So really, I think the first step towards getting more interest in
telemetry, and better support for it, needs to be for some of the users
to start transmitting the decoding information. Ok, seeing "Battery:
12.5V" on the screen might not be very interesting, but it's better than
"Analogue 1: 125".

```

I guess the reason is that it takes 4 packets and there is not an easy
way to put all of those in the TNC... OOPS. HAULT. Ah HA! Yes, every
KPC-3+ that can do telemetry also has FOUR LT buffers. So simply load
the four TElemetry formats in those four LT buffers and set it to once
every 4 hours or so (to minimize channel loading) and set the LT paths to
DIRECT (so you dont burden the whole state) and that does it!

Neato...

Great.
Bob, WB4APR

322. [aprssig] Location Queries

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 18 Oct 2002 09:32:42 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: aprsnews@lists.tapr.org
Message-ID: <LYR842-103378-2002.10.18-09.15.42--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

NEW IDEA!

How about we implement a GENERAL HEARD QUERY that works as follows:

Sending station sends ?APRSH?cccccc

And every station within range that has heard station cccccc DIRECT
responds (with a random 1 minute time delay) with the normal response to
a directed APRSH query. (no report if not heard direct).

Then the SENDING station's APRS can simply plot the PHG's of responding
stations and color them solid to show the area in which the missing
station can be found. Brighter colors for more packets and most recently
heard...

The multicolor PHG plots would use a similar scale of colors that
APRSdos uses (for example) to show signal strength contours in omni-dfing.
Thus the location of the largest number of stations that heard the
missing station the most recently would be bright red and those that
havent heard him for a while would be more and more dark and gray....

Hummh...

It would be nice if someone would apply to the assigned numbers group for
specific ports with specific names so that the use is documented and reserved.
Then, any use of ports such as 23, should be in parallel with another port so
that firewall isolated clients can use 23 if that works for them, but
otherwise, servers without the ability to override the use of 23 would use the
standard port for that service.

I want to put a digi on a near-by water tower. All too
familiar with the traffic here, I need to use the donated
KPC3 (not a +) with v8.2 firmware to eliminate dupes and
such. Unfortunately Kantronics says the firmware is no
longer available.

Does anyone know where I might get either a burned (or
original) EPROM or the code to have one burned? TIA

[snip]
>the four TElemetry formats in those four LT buffers and set it to once

That's great unless you're already using those... Around here we tend to use at least some of those so that we can get variable paths on the beacons. As an example my home station was testing settings for possible digi use. It sends it's position at least every 20 minutes throughout the day. The majority of those are local only. On the hour it sends 1 wide. Twice a day it sends a bigger path.

In reading the telemetry.txt file (at least the version I found on a web site) it implied that there were default values for the telemetry, but didn't mention what they were. Are there? What are they?

It also implied that I could send them from another station which might be a way around the digi not having enough ways to send packets. Does that work?

I should also ask - which APRS clients support telemetry? (by support telemetry I mean including the labels, equations, and units.)
Obviously APRSDOS does. UI View has a non-released add-in. How about the others?

Bill

Or!
1. ssh 172.93.1.100
2. xastir &

Not only more secure but easier. This, of course, assumes SSH is setup for tunneling properly on both systems. (Works by default on all my Redhat systems. Even with Windows as the DISPLAY machine using Putty & Exceed. :-)

Bad advice, this allows anyone on the network (or the whole Internet if you're not behind a firewall) to snoop your box.

On Sat, 19 Oct 2002, Andrew Rich wrote:

> do u have to allow that host in ?

Once someone starts up and X-server on a box, that user owns the desktop. In order to allow someone else to talk to that X-server, you normally have to manipulate xhost.

Setting "xhost +" on a box lets anyone in, and would allow someone to create a duplicate display elsewhere to snoop what you're doing, allow them to put a box up on your screen that simulates a login screen (which would allow them to snoop your password were you to type it), etc. "xhost +" is an extremely bad idea.

A slightly better way would be to set "xhost remotecomputername", but this would still allow anyone on that remote machine to mess with your local X-server. If you're in full control of that remote

machine and there are no others logging in there it is probably ok.
Just remember that Unix and Unix-like boxes are all multiuser.
Someone can log in to that box at any time while you're using it,
either if they have a login or if they've hacked that box.

> is this the rhost file ?

This is not the "rhost" file. Most people recommend that you do
NOT mess with rhost. That's a very old method of allowing users
on one computer to have the same priviledges on another. Rhost has
particularly poor security and should not be used. Rhost also has
nothing to do with X.

The simpler and more secure way of doing things like this these days
is to use SSH, or Secure SHell. SSH will create an encrypted
connection to the remote computer and will then set up your DISPLAY
variable on the remote end so that X clients will display on your
local box. It also creates a dummy X-server on the remote end.
With SSH you don't have to mess with "xhost" at all. SSH also
NEVER sends passwords in the clear, unlike telnet and ftp, which
do. SSH also has "scp", which allows you to copy files from one
machine to another in a secure manner. I use that all the time.

It's relatively easy to "fake" packets as being from another station,
simply be writing a program/script to generate the packets and
injecting them into the IS stream. That's how the QUAKE packets and
other similar objects are created. You could do the same with the
telemetry description packets for a station that is unable to
describe them itself. Maybe there are other methods as well.

Xastir does not currently support the telemetry stuff. On the TODO
list.

From: Frank H. Bauer <fbauer@erols.com>

All,

The ARISS team has instructed the Valery to leave the Packet system on 145.825 for an additional week to support the double hop experimentation. We also informed him of the success to date.

With the school group contact this morning, I am not sure if the equipment was re-configured to the prime packet frequency or to 145.825. Some of you were asking about why the packet system was not on the air recently. It is not clear to us what occurred either. Some of the speculation about undocking may be true. There were also a number of Shuttle crew members vying for time on the radio, so maybe the system was not configured back to B6 (The standard packet freq) or configured to 145.825.

During the docking, we had ISS Commander Valery Korzun, Shuttle Mission Specialist Dave Wolf and the Shuttle Commander Jeff Ashby all used the ISS Ham equipment....it is great to see ISS Ham Radio so well used by the ISS and Shuttle Crews. Next up....the Taxi Flight with Frank DeWinne, ON1DWN on-board,

Enjoy the double hop experimentation.

73, Frank Bauer, KA3HDO

This doen't work on Mabdrake 9.0.
Get message: $ xhost +
X connection to localhost:10.0 broken (explicit kill or server shutdown).
Been trying to figure this one out. Also have X11 forwarding option
turned on inside SecureCrt.

Can I just say also that this was on my home hub, there was no intent to have to deal with security.

If it was to go outside my home lan then yes these comments would certainly come into play.

Thanks guys

Well, I finally got it back from Kantronics, and upon initial connection,
it didnt work... checked into it today, and it was jumpered for
HT.... fixed that and it works wonderfully....

Thanks to Kantronics for fixing it, even though it was a factory second and
had no warrantee!!!

Now for the question...

Is anyone running a MOCOM 70 or similar old radio as a digi? I need some
help doing 2 things:

1) how to interface the audio from the KPC9612 to the MOCOM (just running
the 9612's TX audio to the MOCOM's TX audio doesn't seem to work)

2) how to swap the antenna relay with something solid state (schematics and
part numbers would be nice :)

thanks
Ken

The message "explicit kill or server shutdown" is what you get when
you try to open up a GUI program on an X-server which you don't have
proper permissions to use.  I expect you already know that though.

I'm not familiar with SecureCrt, might be a RedHat package or a
third-party addition?  The X11 forwarding option sounds like it might
do some of the same things as SSH.  Check out the man pages for
SecureCrt.  You might have package documentation for it in other
places on your system as well.  On SuSE, package docs are in
/usr/share/doc/packages.  You might have stuff under /usr/share or
under /usr/doc?

> > 1. ssh 172.93.1.100
> > 2. xastir &

Again, this is what I use.  It sets everything up for you so that you
don't have to remember much in the way of details.  You just "play".

On Fri, 18 Oct 2002, Bill Herrmann wrote about APRS telemetry.

> In reading the telemetry.txt file (at least the version I found on a web
> site) it implied that there were default values for the telemetry, but
> didn't mention what they were. Are there? What are they?

They are defined for the MIM (Mic-E). The useful ones are channel 1
should be volts in tenths (126 means 12.6 volts) and channel 3 is labeled
temperature. If you can chose a thermister and resistor combo that
roughly gives you a binary count equal to degrees, then no conversion is
necessary there either. I wrote a program that is included in all vesions
of APRSdos that helps you choose a resistor and diode combo for the common
DIGI-KEY thermisters to yield a linear telemetry count equal to degrees
over a limited range of your choosing. I think it is called mic-temp.bas

> It also implied that I could send them from another station which might
> be a way around the digi not having enough ways to send packets. Does
> that work?

Yes, it doesnt matter who sends the packets, only the TOCALL has to match
the call of the station that is sending the telemetry.
>
> I should also ask - which APRS clients support telemetry? (by support
> telemetry I mean including the labels, equations, and units.)
> Obviously APRSDOS does. UI View has a non-released add-in. How about the
> others?

Good question.

Bob

Rendered body type: text/plain

Well I found out my problem...I think. I had a friend that used my cable
and he was able to use Hyperterm..with my cable. Using his cable he could
not get my TH-D7AG to work, nor could he use his GPS cable to make mine
work. All the settings were correct (I think). TNC on, off,... APRS on,
off,....nothing worked. I took the back off hoping to get to the
jacks....that looked a little scary. Has anybody had this problem? What
about Kenwood? What do they charge to fix something like this? The ht
works in APRS by itself and every else seems to work, just not the GPS nor
PC jacks. Mic and speaker works fine.
Ideas?
Thanks,
Robert

> 1) how to interface the audio from the KPC9612 to the MOCOM (just running
>  the 9612's TX audio to the MOCOM's TX audio doesn't seem to work)
>

The older Motorola radios (like most commercial land mobile radios until
recently) have a very high level mic input that was originally intended
(decades ago) for a telephone-type carbon mic that puts half a volt or so of
audio. [ Part of the reason was to have a very high audio level that would
```

travel well without picking up noise through 25 feet of cable from the
control head to the trunkmounted radio chassis.] For the past 25 years or
so, Moto has provided a dynamic mic with built-in preamp that boosts the
5-10mV output of the dynamic element to 500mV; in other words, it simulates
the level of the classic carbon mic (but with vastly better audio quality).

Any device you wire into a Moto's "mic" input has to be essentially "line"
level instead of "mic'" level as we usually think of it (5-50mV).

If there isn't a jumper inside the TNC to boost the output level by a factor
of 10-20 or so, use a simple op-amp amplifier set for a gain of 20 or so to
boost the 9612's tone levels.

346. [aprssig] MS 2000

From: Linda Mullen <ad4bl@mosquitonet.com>
Date: Sat, 19 Oct 2002 21:46:24 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-103717-2002.10.20-01.24.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,

I thank you for your assistance in this matter of
loading DosAPRS on MS2000. I can tell you from
first hand experience, it won't work! We went up
to the NWS office and loaded it on the new machine
and all we got was garbage. We toyed with
reformating the hard drive and installing Win95 or
98. Young Kody asked our NWS buddy if they still
had the old machine that we had been running the
program on and they sure did. We made quick work
of getting the machine hooked up and on line and
DosAPRS ran like a champ! More than one way to
skin a cat!

We may still reformat the new machine because it
is the one assigned by the NWS for the amateur
radio programs but at least we are back in
business....just in time for a new snowfall.   We
have gotten 15in of snow the past 1 1/2 weeks.

Thanks again to everyone who offered ideas.

Linda

Depending on how new the machine is, you may not be able to do this!! I am fighting this nightmare right now -- new machines with video, sound, modem, and/or CPU support chipsets that are ONLY supported in Win XP. There are simply NO DRIVERS available for earlier versions of Windows.

These devices are increasingly dependent on SOFTWARE that simulates or complements hardware. These drivers are specific to particular versions of Windows; without the drivers, many hardware devices on new PCs simply don't exist. This is particularly true of video displays, modems and sound systems.

In my particular case (Dell Inspiron 8100 laptop) I wanted to replace the factory-loaded Win XP with Windows 2000 but can't get a driver for the built-in ATI Mobile Radeon 7500 video display system that will work with Win 2K (or any earlier version of Windows). I have wasted 4 days on Dell's 800-lines over the last week arguing with clueless idiots in their so-called tech support trying to convince them that there must be a Win 2K driver for this video system (at one point the machine was being offered with either Win2K or XP). So far they insist they only support Win XP on this machine and nothing else.

Without this missing driver, the hot-dog accelerated 1600x1280 super-XGA display is only capable of basic 640x480 16-color classic VGA !

The same thing is increasingly happening with newer printers and combo scanner/printer/fax devices: They are only usable with the lastest versions of Windows.

As I have mentioned on several lists before: If you expect to continue to use legacy hardware (i.e. serial and parallel ports, hardware-based modems that actually act like serial ports, truely "Soundblaster"-compatible sound systems [i.e. for PSK31, RTTY,etc] you had better hang onto your existing machines. With Microsoft's incessant pressure on HARDWARE manufacturers to make new machines TOTALLY dependent on the lastest versions of Windows for basic functionality, new PCs will be less and less usable for a lot of our ham apps.

Or Linux/*BSD Unix.

ATI has a driver for Win2k:

        http://www.ati.com/support/driver.html

I did a search for "ATI Mobile Radeon 7500" on google and ATI was one
of the first hits.  Select the right options and you get to the
download page for it.

Or make the plunge to Linux or *BSD Unix whenever you get backed into
the corner for the last time with Windows.  New versions of Linux
should run without major problems on your old 486 systems and on your
newest AMD Athlon systems.  If some driver or other is missing, and
it's a popular enough card/peripheral, it's usually not long before
someone writes a driver for it.  Often it's the manufacturer writing
them these days.

```
OK, I am going to do it...

I want to make a simple application to do shelter information using UI
packets between the sheters.

I know there was some conversation about this because WinAPRS had a
reference to it.

The first step is for me to ask if there if any data on a packet format for
the shelter information. If you are involved with the Red Cross and can
```

help, please send me what type of information you think the shelter should send to the HUB location (the Chapter). Please send this off-list. I will compile it and put it into a packet format. I will send it out for comments, then submit it to the APRSSPEC-WG to get it put into the SPEC.

Comments?

No you don't. ATI explicitly passes the buck on the "Mobility Radeon" [motherboard-mounted chipset for laptops -- not a plugin card] back to the OEM using it, tells you to "contact your OEM".

Stephen-

Unfortunately, sometimes the drivers just aren't "filed" correctly on Dell's web site. Have you actually downloaded the new XP drivers and tried using them with 2000 Pro? Or, if nothing else, look through the INF files and the directory structure of the download - you should be able to get a good clue of what OSes are supported. I'd look at the file myself, but I'm still stuck on a lowly dialup, and 8MB would take awhile...

Usually, drivers for newer OSes will work with older OSes, but not vice versa (at least for the more recent OSes - 98/Me/2000/XP). If nothing else, look at the drivers for the Latitude C640, which should be a reasonably close relative to your laptop, and you should find Win2K drivers for the Mobility 7500 (aka M7) there.

The upside to the Latitude line is that Dell seems to be more supportive toward using varying OSes and software combinations. That was one of the deciding factors when I bought my C840.

73s,

Hi Sig,

Lately I've noticed that almost all NWS messages, where the
Counties turn different color, now say Advisory, WX_MESSAGE,  but
I seem to remember they would also say what kind of advisory, like
Flood, Thunderstorms, Freeze, or something like that... Just plain
WX_Message seems lacking something?

Am I missing something I need to load for interpretation of these
messages?

Thanks,

Robbie,  wa9inf

Of what software?

Most APRS programs can be found on the TAPR site.  Go to
ftp://ftp.tapr.org/aprssig/ and take a look.

SecureCRT is a windows terminal emulator that provides SSH and associated
tunneling.  There is a checkbox for X11 forwarding.  Of course, if you don't
have an X-server running at all, then you will likely have problems getting
anything to work that uses X-windows.

>Ideas?

I had a cold solder joint on my GPS port on the D7.  When I opened the thing
to inspect why I could not get the GPS to work except when it was powered by
the same power source as the radio, I found a fried component that appears to
have been damaged by excess current.  It may be that you have a manufacturing
defect, or a current dammaged component too.  I am preparing to send my in for
repair.  The GPS port is working very irregularly and the ever present
firmware bug that causes poorly formatted packets to kill the TNC and make
X-mit and Recv stop working, is getting on my nerves.

I don't know if the version 2 of the D7A(G) is a firmware upgrade or not...
Will check on that before sending it in, or just write them a note to upgrade
it if that is possible.

:-(That sucks! Perhaps there are several methods of interfacing
their chipset into various motherboards, and they didn't want to
support all of the possible good & bad methods that the motherboard
manufacturers might have chosen.

Another possibility would be to find another manufacturer's site that
has a Win2k driver and try that. Might not work, but you might get
lucky.

This is what's happening on third.aprs.net.. I refuse to let the aprs
server run as root (to bind to a port <1024.. e.g. 23), so 23 is being
redirected to 10152.

Not for the same reasons, but I agree with you anyway. :)

Rendered body type: text/plain

Is one of those times when one faces the difficult decision of
purchasing a new radio!
Is the THD7A really what it claims to be?
Is it worth the money?
Is it dependable?
what do "you" not like about it?
Am seeking input to help me decide on purchasing one.
many thanks....ve7whk

It's only worth the money if you're going to use it for packet or APRS.
Otherwise get one of the new 5w palm size HT's.

Kevin,
First the good:
 Personal tracker with just two pieces of equipment is great.  The ability
to have the a small package for weather alerts and sending small text
messages is outstanding as well.
Now the bad:
Standard battery is not enough to power the radio if your planning on using
both bands and the tnc with no battery saver to be able to catch packets.
Even the extended packs that Maha has that is either 6V 1800AH or 9.6V
1050AH on high power for transmitting is not really able to stand up to it.
If the TNC is just used on the rig it receives fine. Using the TNC in
"packet" mode makes it deaf as a post and needs an external antenna for any
kind of reception. I would recommend a good power supply for extended
operation. I do love my rig and would not trade it in for anything but it
does have its limitations but if its small package that you want then this
is your radio.

I've loved mine. The only complaint I've had is the battery charge
connector. I had to replace one on my first D7 and I don't get a very
positive connection on my D7(G). I have to admit that I've been pretty
rough on them though.

I love mine too. Just dont drop it. The radio was hit while on my belt.
the battery clip let go letting the radio fly off. The radio (sans the
battery) hit square on the bottom, cracked the battery clip, the exterior
plastic case was okay but the "pot metal" backplate/heatsink of the D7a
broke.

Kenwoody wanted too much to repair so I use it at home on a power supply as
a tnc/radio combo.

I wish it was mobile again but it was too expensive to repair.

Lloyd KD4HTW

While we are on the subject of Kenwood evaluations, how does the D700 stack
up. I would like to use GPS and general purpose dual band mobile ham in
addition to MARS. Any one got any idea of receiver & transmitter
performance once you leave the ham bands? Thanks. 73's

Just my 2 cents worth...

I really like my D700A. I haven't had any problems with it. The
receiver seems to be pretty consistant throughout the VHF and UHF band
(Amateur and Non-Amateur). The transmitter appears to be stable
throughout the MARS/CAP portion of the band. I haven't been able to
tell the difference in Amateur frequencies and military frequencies as
far as coverage. I wish I had the time to put this radio on a scope
and a service monitor to be able to tell where the radio starts to
significantly drop off in sensitivity and power. Maybe someone on here
has done that.

73s,
Eric KF4OTN

Its main attraction to me is its ability to do APRS and voice at the same
time. My other dual band rigs do not do this smoothly. Receive outside the
ham bands seems fine but I have no experience with TX.

>
>I should also ask - which APRS clients support telemetry? (by support
>telemetry I mean including the labels, equations, and units.)
>Obviously APRSDOS does. UI View has a non-released add-in. How about the
>others?

I asked in May if anyone was using the label feature:

http://www.tapr.org/tapr/list-archive/aprssig/0205/msg00513.html

I only got a single response, from Henk de Groot, that DIGI_NED send them
(though apparently with a path that prevented them from reaching the APRS IS). I
concluded there was no need to support this feature within findU, though I'm
willing to revist that.

I have a preliminary cgi working (which I also mentioned in that May message),
but haven't done much on it due to a lack of interest from the masses. It plots
the values one report to a horizontal pixel, there is no time scale, which is
the major part of the work it needs to be complete. Some interesting plots:

http://www.findu.com/cgi-bin/tele.cgi?call=KJ7AZ-6&last=120
http://www.findu.com/cgi-bin/tele.cgi?call=K13C&last=120
http://www.findu.com/cgi-bin/tele.cgi?call=VE7MR&last=120
http://www.findu.com/cgi-bin/tele.cgi?call=K9D9&last=120

I can put this back on the infamous do list if people have an interest in it...

If anyone is sending the equation/label packets, and they are making it to the
APRS IS, please let me know...

Steve K4HG

One of the ideas I considered with was to have them be parameters to the
cgi...it would be long and ungainly to type, but would allow people to have a
link on a web page to show off their data. This would do nothing for on the air
clients though.

I am looking at putting a WX station the house and wanted to know what there
is on the market that will work with APRS? Is there a wed site that has a
comparison of the stations that I might be able to take look at? Any
information would be helpful.
Thanks for the information in advance!
Peter "Dakota" Summerhawk

How much money you got to spend?  ;-)

As I understand you can hook a weather station directly to the
KPC3plus and send weather info.  Is this true and can some one share
some more info on it please?

Check out  Weather Display.  Great program and creates the WX file needed
for most APRS software.   Supports just about every model of weather
station.

```

I have had my D700 for nearly a year now. It has preformed flawlessly and interfaces cleanly with my Garmin eTrex Legend. If you are doing mobile APRS, this is the only radio to buy. I have used the radio outside of the ham bands and noticed no real problems. I can't speak toward spectral purity, but power holds up fairly well out-of-band; better than 85% on both UHF and VHF on the high power setting.

Living in Florida and traveling to the Southwestern United States once a year or so, the inside of my car often gets uber hot. Early on, I was worried about the D700's display. It survived summer in Florida, New Mexico and Arizona.

If looking for just a dual band rig, I can't say I would recommend the D700. It costs too darn much if you aren't going to use the APRS features. If you are into APRS, I wouldn't recommend anything but the D700.

(As a side note, I bought the D7A(g) almost a year before buying the D700. In retrospect, I wish I didn't buy the D7 and instead got a simply dual-band radio. While a fine radio, I find I hardly ever use it's APRS features anymore. I generally only APRS while mobile. The D700 fixed a lot of my minor gripes with the D7. I find the battery life to be fairly short when both bands and the TNC are running. By the time you add in the radio, spare batteries, GPS, cables, etc., the D7 is fairly cumbersome. I can't imagine using it pedestrian mobile for any length of time. I have used it quite often bicycle mobile but I tend to run out of battery power long before I'm done riding even with a spare battery. So, for APRS, unless you *really* need an HT, the D700 is really the better deal.)

Matt (k4mls)

I haven't had any out of bands experience. I do wish it would receive the Commercial FM band, but oh, well.

Mine has been pretty solid so far. I carry mine on the back of my motorcycle and it hasn't yet complained about the vibration or temperature extremes. I did have to replace the control head wire. Knock on wood, that's all so far.

So tell me, from an overall perspective, what's it like using the D700?

I've tried a number of approaches, multiplexing the TM-V7a (which I did not like!) and for now, settled on a kpc-3 based dual mode tracker running UI-View, or just as a dumb tracker.

What constraints am I going to see, having APRS back in my main voice radio?

as far as the GPS and the D7 goes I found a solution for that. http://www.galls.com/shop/viewProductDetail.jsp?item=FE280 they sell a dual pouch chestpack for such equipment I have also found that there are a lot of sporting goods stores that sell dual pouch belt holsters for holding GPS and the D7 I have been using the D7 with the Maha hicap packs and the posit report rate of 2 min. I have also used a hi gain antenna like the SMA-3 or the HT-224 from Comet. All of this seems to work well for the most part. If your using both bands and the tnc the D7 eats batteries like no tomorrow if the power for the data side is set to high power. But if you are in range of the local digi set it to low or extra low to conserve battery life. I have the data side set to low. and the posit rate set to two min. Hope this helps

When I'm travelling, I set the D7 to digi through my car.
20mW on the HT, 50W out of the car. Car power is a lot cheaper :)

There will be times when the data (APRS) channel will override the voice
channel. The voice channel is capable of dual band operation, just one band
at a time. All on one antenna!

Can the priority be adjusted?
In the V7, data has priority, period.

"Yeah bill I see a "<BRAAAK>" by the intersection of "<BRAAAK>

Unacceptable.

Umm.  I notice mine all the time.  ASSUMING you are talking on 2 meters and
running APRS on 2 meters, the priority is Voice Transmit, APRS Transmit, and
then Receive Audio.  So you will be talking to a person on the repeater, key
down, APRS will transmit immediatly, and successfully cover up the first few
words the other person is saying on the repeater.

According to the manual, if you are using a 70cm repeater, this doesn't
happen, but I havn't tried that yet.

Concerning the D700:

If the unit is transmitting APRS data, it will disable your PTT line
until it completes the data transmission.

If you are talking, the APRS transmission will hold off until the
PTT is released.

I use the radio primarily with uhf on the right side, and APRS on the left.
If APRS transmits, it shuts off the receiver on the right.

In the D700 you have the option of using the data tx band or both bands
a & b for dcd sense to inhibit transmission- my experimentation leads me
to believe this is not true dcd sensing- voice modulation on the b band
will inhibit transmission on the a band if dcd sense is set to both.
This effectively lets you set which has priority - aprs or voice.

http://www.eskimo.com/~archer/xastir.html shows which weather
stations are currently supported with Xastir.  Might not be what
you're looking for, but it _is_ an option.

$88 + about $35 shipping (Fed Ex from Mexico, the only option) gets
you a One-Wire weather station with temperature, wind speed, and
wind direction.  That's pretty cheap.  It's supported in Xastir now.

I think that's the cheapest option going.  You can sensors to it as
money allows.

I find this NOT to be the case.  If the D700 transmits on APRS
(144.390MHz) it will not affect the UHF side (transmit nor receive).

The Peet Brothers' units are the most APRS friendly in my opinion. You do not need a
separate computer interface to keep it online. I have one that has been running for
several years without problems other than loss of power, I now have it on a UPS.

You may view it in operation at:

http://www.findu.com/cgi-bin/wxpage.cgi?call=w5vex-1&radar=ewx&last=120

Peet Brothers has a web site at:

http://www.peetbros.com/

They also have excellent support...

Joe Dorn, W5VEX, Belton, Texas

Yup! The One-Wire stations have no intelligence built-in. You have
to have something querying it for the readings on a regular basis.
If you're running APRS w/Weather, you probably have such a computer
available to do it.

If you're after something that will give you readings even when your
computer croaks, with a nice display that looks good in your living
room, one-wire is probably not for you.

I think I mislead some people already. The one-wire will not hook
directly to a TNC. I wanted to make that clear. You need a
computer between it and the TNC, 'cuz the one-wire has no
intelligence of it's own. The TNC does not know how to query the
one-wire for it's data.

Thanks to Spider for pointing this out!

Haven't played with UHF, but you can set the radio to hold APRS Beacons if there is activity on the Voice band (Band B in my case, usually 2 meter). I.E., you hit the time of next auto beacon, and there is activity on the voice band, it will hold the packet until the carrier has dropped on that band, and then transmit the beacon

On a busy repeater, this can mean that you will never transmit a beacon, so mine is set to transmit regardless of activity on the B band. I've learned to work around the occasional drop out, and I always have the option of disabling the beacon transmit (PM's are a GOOD thing!)

I would be very interested in this. Over the years I have played with Peet Brothers units and known many people that own them. Sorry to say that they do not appear to hold up very well and fail very often. I would like to purchase one myself for a stand alone station but refuse to spend $300+ and have it fail within a couple of years.

If a PIC were available to make "x" WX station stand alone you can either go the cheap route and consider them disposable or go to the other end and purchase one of the more professional models which cost "mucho bucks". At least you can be certain that it will survive a Cat4 Hurricane and last a long time in normal operation.

Dual HSP would be very nice on the PIC since some who co-locate with a repeater could then feed not only the APRS TNC but also some of the repeater controllers that accept the Peet input to announce the WX info with the TI voice chip.

You could use the TAPR T238 if you don't want a computer involved. But
then you're probably getting close to the cost of a fully-integrated
weather kit from Davis or some such.

Bill N2RKL (who has no weather station. . . yet, anyway ;)

I would also like to add a PIC to a PEET wx sta on a DIGI so the
local D-7 & D700's will decode the weather as well. However I would not
need the modulation part as I still would like to use a KPC-3. I want
to place the PIC between the TNC and weather station. Any suggestions?

I have been using a Davis Weather Monitor II for over 5 years without any
problem. Use Weather Display for display and APRS.   Great combination.

I, too, have been very happy with the Davis Weather Monitor II. I got the
wireless version, a little more expensive, but I probably would never have
gotten the wired version installed.

I also got the Weather Link module and software (I think that's what it's
called). I have to disable the WX port in WinAPRS temporarily to download
the contents of the Weather Link thingy into the software. It appears it
will store years of WX data and draw a multitude of charts and graphs.

I have a Davis weather station which has been in service since 1994 and sending data to WinAPRS 24/7/365 and sofar has only failed twice when hit by lightning, the weatherlink interface was the culprit and was repaired for less than $40.00, I think this quite a good performance, I also have an Oregon Scientific station which has not been quite so reliable but without major problems.

Exactly my point, there are many other weather stations out there, more and less expensive than the PeetBrothers.
I think the only reason the PeetBrothers unit is so popular is that it is the only game in town for direct TNC interfacing. Now if we can do a PIC to change that I think many would jump on it.

Not everyone want's to have a WX station at home and on that same note not everyone can afford or can have a PC at a remote site just to make use of a Non-Peet unit.

Rich

411. [aprssig] WX for NWS?

From: "Peter \"Dakota\" Summerhawk" <dakotas@dotorg.org>
Date: Tue, 22 Oct 2002 13:38:08 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-104061-2002.10.22-15.21.30--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

OK maybe I should have been more clear I am looking for information that the
WX station will be used for the local NWS office and will be hooked in to a
APRS station running WINAPRS. As well as for my own weather station I am
planning on building the station for the home as well. Along another line
can the WX station at the NWS be a digi? The nearest digi is a good 40 miles
away and if the NWS office can be a digi then the signal will have to just
travel across town instead of across county. Can someone help me with this?
Thanks
Peter "Dakota" Summerhawk

You'll need to look in the docs to see what brands/models are
directly supported by that app then.

> Along another line
> can the WX station at the NWS be a digi?

Yep. As long as you have a computer/TNC there, it'll do that as
well. For a dumb digi the TNC just gets set up with RELAY
activated. This is usually done automatically by the APRS software.
If you want a smarter digi (WIDEn-N style) then you may need to do
something else. For RELAY though, you're covered.

The only thing you need to make sure of is that you have two serial
ports free for your use on that machine, one for the TNC and one for
the WX station.

> If the D700 transmits on APRS (144.390MHz) it will
> not affect the UHF side (transmit nor receive).
> Eric KF4OTN

I, too, find that to be true. With VHF on A and UHF on B it is just like having two radios. There is little if any interaction.

When you're running VHF/VHF, however, you will lose receive audio on B when a packet is sent on the A side. Since packets are so short, I find less than a word or two is missed. With my beacon rate set to three minutes most of the time, that is more than an acceptable trade off.

Voice transmissions are never interrupted by the data side of the radio. They can, however, be delayed if the same band (UHF/UHF or VHF/VHF) is active on both sides. For example, if a packet is already sending on 144.39, you must wait for the packet to be sent before you can key-up on 146.52. Once again, this second or two delay is hardly noticeable.

Thanks, everyone, for the input, but I think I'll stick to my separate radio.

Thanks to a bit of antenna separation, I never need to think about the APRS station.

I did add a helical filter to my SSTV station, which keeps the APRS from blanking the received pictures, as long as the signal strength is reasonable.

The V7a, when not used for data, has only two bad features.
The display, easily the worst I've ever seen on a mobile radio, and the hot mic, which lets anything that sounds like DTMF control the radio. Wouldn't have taken much to mute the mic when we're not transmitting, and I can't figure why they thought it would be a good idea to mix a hot mic with DTMF control signals when not transmitting, but that's what they do.

Rendered body type: text/plain

> overall perspective, what's it like using the D700?

The D700 is a fine radio, meeting or exceeding the quality of many other dual-band radios. That it throws in APRS for less than the cost of a dual-band radio, a TNC, the related cables and headache of keeping it all connected and functional is a real bonus.

In fact, the only two complaints I regularly hear

about the radio is that it has low audio when used as
a cross-band repeater (a feature I don't use) and it
isn't fully AX Level II compliant (I don't even know
enough to check if that's true). Those two complaints
are fairly esoteric compared to all the things you
could hate about a dual-band radio.
    If you haven't already read the eHam reviews of
this radio (it gets a 4.1 out of five with 23 hams
voting), it would be worth your time...
    http://www.eham.net/reviews/detail/1118

> multiplexing the TM-V7a (which I did not like!) and
> for now, settled on a kpc-3 based dual mode tracker
> running UI-View, or just as a dumb tracker.

    Maybe I'm just a wimp, but I can't imagine using
anything other than a D700 for interactive APRS. (For
a dumb tracker, there are cheaper options, of course.)
The radio is tightly integrated. I turn on the car,
the GPS and the radio and I'm ready to go. It never
loses its configuration. I don't have to worry about
my laptop melting in the car. Even sending messages
using the microphone keypad isn't nearly as clunky as
I was afraid it would be. I can write a message and
send it at a stop light. Very nifty.

> What constraints am I going to see, having APRS back
> in my main voice radio?

    Running APRS on one side of the radio means you
basically lose that half the radio for voice.
    I used to keep 146.52 on one side of my radio at
all times and on the other side I was tuned to a local
repeater or just scanning. Since getting the D700, I
am unable to keep 146.52 up at all times. Instead, it
gets scanned with the rest of the frequencies and if I
pause on a repeater and am talking there, I have nothing
tuned to the calling frequency. All told, that is not
a real big problem.

Speaking about displays...

The LCD is also of poor quality. I remoted mine on the headliner of my truck
when first purchased 2 years ago. Now segments are missing (vertical lines)
on the VHF side first and now starting on UHF. As the day goes on and it is
powered up sometimes they return.

Radio never pulled and mounted on headliner so it has never been hit or mistreated.

I got mine replaced by the factory, out of warr, but they did it free.
They didn't use zebra strips, the cable is GLUED to the display glass.

The uWx station is a great little project. It will take you no more than 2
hours to build if you have a steady hand. I built one with LCD for about $150,
and it hasn't failed me once. Once you build it, go to your local Cable T.V.
office and see if they have any old leftover gray Primestar boxes. (The ones
you mount all the wires in.) They make great inclosers for the weather
station.

If you decide to key up the voice channel *just* as the data channel decides
to transmit you may end up talking on the data channel. It's happend to me a
couple of times.

The TinyWX (or whatever Byon calls it) does exactly what you just asked for.
It is in Beta testing at this time.
It will interface a Oregon Scientific wm918 to a radio, without the need for
a TNC.

Jason, It's a volunteer effort, so most likely when the volunteers have time
we'll have the audio. It's typically a few months are DCC that it gets
posted. Until then we just get to wait anxiously!

-Jim KB0THN

424. [aprssig] Joint ISS/PCsat dual hop success (2)

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 22 Oct 2002 19:16:31 -0400 (EDT)

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-104091-2002.10.22-18.59.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Today from 2007z to 2013z on 22 October both ISS and PCsat were in view of the USA. Dual hop packets I copied were:

```
[20:07:43] WB6OLA]CM99GK,W3ADO-1,RS0ISS*,qAR,WB0WNX:Hi WD5EEV
[20:09:20] WB4APR-3]APRS,W3ADO-1,RS0ISS*,ARISS,qAR,WB0WNX:Ping...# 2
[20:09:37] N8IGJ>CQ,RS0ISS,W3ADO-1*,WIDE/1:
[20:09:39] WF1F>MILES,W3ADO-1,RS0ISS*/1:I got a doble ping
[20:09:43] WB6OLA>CM99GK,W3ADO-1,RS0ISS*/1:Hello de Carl in Chico, Ca
[20:09:52] WB4APR-3>APRS,W3ADO-1,RS0ISS*,ARISS/1:Lets try OPS NORMAL for a while
[20:09:52] WB4APR-3>APRS,W3ADO-1,RS0ISS*,ARISS/1:Ping...# 3
[20:13:59] KB1GVR>CQ,RS0ISS,W3ADO-1*/1:=4436.18N/06826.92W-> Ellsworth ME6
```

The last packet was a DX record for satellite-to-satellite packet of 1340 miles between birds. To see the geometries involved, see the PCsat web page below.

Rendered body type: text/plain

I guess I toss in my offering here too.

I make and sell a simple wind speed datalogger and display. It uses a $50 anemometer from Fascinating Electronics to measure the wind speed, then displays the speed on two 7-segment LED displays. There is also an APRS mode which supports the anemometer, a digital temperature sensor, and almost any type of rain gauge. In APRS mode it interfaces directly to a TNC @ 1200 baud.

For more details look at its web page:

http://www.aprsworld.net/windspeed/

So basically for about $90 ($25 for kit + $5 for temperature sensor + $60 anemometer) you can have a wind speed, wind guest, and temperature weather station.

Hi Bob and all.

I'm just curious how to tell the difference between a packet that's digipeated through only one of the birds and one that made a hop between them. Do both repeated packets in a dual hop have to be received somewhere, or am I missing something?

Thanks

Bruce - VE5BNC

I use my 700 on UHF all the time, with aprs on 144.39. If I'm receiving on uhf, and aprs transmits, the uhf audio is muted.

73,
Jim

Double hop packets are just like on the ground.  If the second digipeter
in the list has the *, then it went two hops...  What a great test!

I've only had my D700 for a couple of weeks now. It is essentially new condition purchased from a ham that didn't like the display readability in direct sunlight and really didn't use APRS.

So far, 4 out of 4 D700's in the local group here produce very low audio levels from the microphone. In all cases it is clear and readable, just low level requiring close and loud talking into the mic. Good for mobile noise canceling I guess. Very much different from the Alinco radio microphones which are usually so hot they require quiet talking at about 2 feet to over drive them.

I went thru the app notes and service bulletins on the Kenwood site and found nothing about a level problem with the D700. Am I just going to have to adapt and talk loud and close for the D700? And, YES I'm talking into the front of the microphone!

I've been following and enjoying the D700 discussion so far.

I don't know, but a thought would be that since
packet is about 3 kHz and voice is normally 4.5kHz
they may have set the deviation for the lower readin'

I just bought a D700 this weekend and was told the same thing.
2 meters seems better than 70 cm. Help; inquiring minds want to know.

Exactly what a mobile mic should be to not pick up road and wind noise!

Laptops especially... Most of them have forgone all but the simplest of audio inputs and outputs (mic & headphone). I just got a call this weekend from a client frantic that his new laptop wouldn't work with his video projector's remote as he was getting ready for a presentation. I discovered that this state-of-the-art HP P4 fullsize laptop has no PS/2 port(s). Oddly enough, despite the fact it also lacks a legacy serial port, it does have a parallel port. Go figure...

>In my particular case (Dell Inspiron 8100 laptop) I wanted to replace the
>factory-loaded Win XP with Windows 2000 but can't get a driver for the
>built-in ATI Mobile Radeon 7500 video display system that will work with Win
>2K (or any earlier version of Windows). I have wasted 4 days on Dell's
>800-lines over the last week arguing with clueless idiots in their so-called
>tech support trying to convince them that there must be a Win 2K driver for
>this video system (at one point the machine was being offered with either
>Win2K or XP). So far they insist they only support Win XP on this machine
>and nothing else.

The 8100 originally shipped with the ATI Rage (3 or 4 - can't remember which) mobility chipset. The Radeon 7500 was initially a $100 option, and I believe it required Win XP as the OS (A "can't build" with Win2K - to use OEM Jargon). Very few OEM's ever adopted the Mobility 7500 and the Inspiron 8100 was the first, making it quite a rare animal. This may be why it's impossible to find a Win2k Driver. There may be some way to force the Dell HTML install routine to extract and run on Win2k, but I'm not sure how. Maybe manually unzip, extract to a folder, and manually install?

As for the clueless idiot tech support people... I used to be called that (or much worse) when working for Gateway by people seeking tech support. ;) Funny how people who couldn''t find the "any" key thought I was the idiot.

But believe me, I sympathize. I recently had to call Gateway for a replacement part, and got a North Sioux City (Manufacturing HQ) NT/Win2K tech, who's supposed to be Gateway's shining front-line cream-of-the-crop technical support professional. This guy could barely type and drool at the same time. It took him about 40 minutes to document a known issue and enter an order for a replacement video card. I went into trainer mode and explained where he was not meeting Gateway's expectations for a TSP in terms of phone patter and speed. This is a call he should have been able to complete in 9 minutes or less. I really do feel in the last 2 years OEM's have really hit the bottom of the barrel tech-support wise. I remember being at a skip-level meeting and having the call-center director telling us they would no longer just be hiring warm bodies, but only qualified computer people - about 2 months later we got in a new group of recruits, and in them included people straight from the State Penitentiary who hadn't seen a computer in 17 years. So much for not hiring warm bodies...

Although, there are a lot of clueless tech support people, there is a problem with bright people being reigned-in and forced to toe the company line. If there was a driver for Win2K and the higher-ups decided to pull it from the web site, the better than average tech support person has no power to stop that, nor may he be able to tell you where to get a driver for it. I suggest you ask or search around on some of the Dell support newsgroups.

I am currently fighting with a dog of a Inspiron 8000 (early chassis), and it has to be the most I/0 bound computer I've ever seen since a Packard-Bell. I am truly becoming a rabid hater of all Laptops Dell. This laptop has Win2K and takes over 3 minutes for the Icons and systray to come up after it boots to the desktop. It's got 128 MB, isn't loading too much, and I've installed the latest BIOS, video, network, and 815 drivers. Ironically the owner wants to put WinXP on the machine. Maybe we could trade? :)

>As I have mentioned on several lists before: If you expect to continue to
>use legacy hardware (i.e. serial and parallel ports, hardware-based modems
>that actually act like serial ports, truely "Soundblaster"-compatible sound

436. [aprssig] The Q stuff (qAs, etc) on RF broadcasts ...

From: "Maiko" <maiko@langelaar.net>
Date: Tue, 22 Oct 2002 21:55:0
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-104117-2002.10.22-22.37.50--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Greetings,

If I gate frames to RF from the APRS-IS, I am guessing I should strip out any of the Q information (if it is present) from the source path header that I receive from the APRS IS, before it is sent out RF.

Is my guess correct ? Is this *procedure* detailed anywhere, as the 'q.html' document does not *seem* to address that part of the equation (or possibly I have the incorrect document).

Not to start any old *wars*, but is there any benefit of having the Q information gated to RF ? I've been very inactive in this stuff as of late due to lack of job (which is a priority). Any past discussions on this, I've honestly missed cause I wasn't around for it.

Best regards,

Maiko Langelaar / VE4KLM

437. [aprssig] RE: The Q stuff (qAs, etc) on RF broadcasts ...

From: "AE5PL Lists" <HamLists@ametx.com>
Date: Tue, 22 Oct 2002 22:44:55 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-104123-2002.10.22-23.27.50--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The current standard format for gating to RF from APRS-IS is:

```
IGATE>APRS,PATH:}FROMCALL>TOCALL,TCPIP,IGATE*:payload
```

Note that ALL original path information other than the FROMCALL and TOCALL are stripped from the third-party header before gating to RF. IGATE is the IGate's callsign; PATH is whatever path is set for the IGate.

The q construct is only for use on APRS-IS. It is designed to show entry points (IGates) as well as to reduce/eliminate loops caused by poor server configurations. It was designed specifically to NOT get gated back to RF.

438. [aprssig] Re: Joint ISS/PCsat test (detail comments)

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 22 Oct 2002 23:50:12 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: sarex@amsat.org, <amsat-bb@amsat.org>
Message-ID: <LYR842-104124-2002.10.22-23.33.11--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

In the previous REPORT of the dual-hop packets between ISS and PCsat, there are a few packets of special interest that deserve comment:

The first packets were out over the pacific with only the west coast inview, thus the numerous (7) easy DX successes (the first was over 1880 mi): This decodes to a position in Seattle Washington.

```
> [20:01:16] K7FZO-1>4W3YVV,RS0ISS,W3ADO-1*,SGATE,WIDE:'2^Al#1k/]"41}@arrl
```

In the next packet below, notice that I didnt get acess to PCsat until 5 minutes later to command it as usual to power saving mode to make sure it could support a heavy user load for this pass. The 7 previous successful packets shows us that PCsat can support dual hop packets even without command station support.

```
> [20:05:42] COMAND-1*>WB4APR-3 <UA>prompt:OUTPUT was 11111111...
```

The next packet shows the Batterys almost fully charged at 16.5 volts each! But these are very weak NiCd's that are "soft" and near death, so a high voltage under charge doesnt really mean things are all that great... and the telemetry counter of #020 shows us it has only been alive for 20 minutes even though it has been in the sun almost 40.

```
> [20:06:21] W3ADO-1*>BEACON,SGATE:T#020,165,165,067,219,213,00111111,0111,1
```

The next two packets are another first. it is the first time a satellite has reported its own telemetry and ID via another satellite.

```
> [20:08:25] W3ADO-1>BEACON,RS0ISS*:T#022,079,067,077,101,213,00111111,0101,1
> [20:08:40] W3ADO-1>ID,RS0ISS*:W3ADO-1/R XBAUD/G MAIL-1/B
```

The next packet shows that ISS is now configured to also digipeat its own packets via another satellite or ground station with the alias of SGate. I was supposed to add SGATE as a UI-DIGI alias on PCsat so that PCsat would do the same for ISS. That is, it would relay the ISS beacons when ISS was normally out of range of any other ground stations. (I forgot to enable SGATE on PCsat for this pass).

```
> [20:08:52] RS0ISS*>CQ,SGATE:>ARISS - International Space Station
```

The next two show a single original packet picked up by both spacecraft and then both spacecraft relay it successfully via the other. This is the normal APRS generic routing method where the packet was generically transmitted using the path of via WIDE,WIDE, and then each satellite recognizes the alias of WIDE and then digipeats the packet while substituting its callsign in place of the generic WIDE so that the actual path taken is shown. (This only works when I am able to set the WIDE alias on PCsat DURING the pass. THus it worked here, but don't plan on it, because PCsat forgets all settings every 100 minutes.)

```
[20:09:51] WB4APR-3>APRS,RS0ISS,W3ADO-1*,ARISS/1:Lets try OPS NORMAL
[20:09:52] WB4APR-3>APRS,W3ADO-1,RS0ISS*,ARISS/1:Lets try OPS NORMAL
```

And the last packet was again pretty good DX as both satellites passed over the East coast and yielded a 1340 mi path between birds.

> [20:13:59] KB1GVR>CQ,RS0ISS,W3ADO-1*/1:=4436.18N/06826.92W-> Ellsworth ME6

Again, the purpose of this test was to show how much utility we can get out of a simple UI digipeating TNC on orbit especially if we have multiple such TNCs and satellites on the same frequency. Remember, ANY satellite can do this if it just has a TNC on 145.825. That's all PCsat is, a TNC and a 555 timer to reset it every now and then. PCsats RESET problems are not related to that design, but only to the loss of one solar panel on launch and subsequent negative power budget during periods of eclipse.

We have access to two more satellite launches next year that are going to let us fly some more TNC's too. These will be short 1 year missions tho, so I hope others are in work to get us towards the goal of a constellation of UI digipeating satellites on 145.825 with one always in view of the most remotest of travelers or portable operators.

Mark et al.

Unfortunately, I've had nothing but luck with Dell laptops. I recently purchased a Latitude C840 (P4/2.2GHz, 1GB DDR SDRAM, 60GB HD, GeForce4 video, configured with dual batteries and a DVD/CD-RM simultaneously, loaded otherwise), and it can boot into Win XP Pro and initialize IIS, Crystal Enterprise, SQL Server 2000, and over a dozen other programs in around 30 seconds from cold boot. The support issues I've had (fractured latch on the multibay) have been handled in minutes by people who were actually pleasant and knowledgable. Fortunately, I have Gold support on the unit.

Other Dell laptops in the past have been similar in quality. I've always purchased Latitudes, as they were available cheaper - however, the Inspiron 8100 (8200, maybe, one of the two) can have its BIOS flashed to think it's a Latitude C840, so there can't be too much difference (if any) in the two units. I've never played with an 8000, however. Hopefully, you just got a 'bum laptop'.

Fortunately, my laptop has a 'real' serial port, parallel port, etc. To jump off on a new subject: Unfortunately, more and more laptops (and desktops) are going the USB route, as manufacturers try to get rid of the old serial, parallel, PS/2, etc. dedicated ports in favor of a universal port, which makes sense from more standpoints than simply monetary. I'm afraid that, at risk of flames, the ham community needs to accept this trend, and begin moving hardware and software over to these new technologies. DOS has been dead around a decade as a current product, Windows 3.1/95/98/NT/Me have died, Windows 2000 is dying, serial ports are over a decade old and are by comparison very slow, and Linux is not the answer for *everyone*. Like it or not, these new technologies will come, and there's not much we can do to stop them. Computers with old serial and PS/2 ports will only be available for so long. As far as the OS, Windows is generally more user-friendly and is certainly more supported, even if many people do have issues with it (if Linux eclipsed Microsoft tomorrow, I wouldn't cry, so don't think I'm defending MS - however, an MS vs. the world argument is beyond the scope of this message).

This is definitely not a criticism of any of the developed hardware and software out there for the ham market! I applaud those who have spent countless hours developing the APRS tools, among MANY other 'ham' tools out there. However, these solutions can only survive on increasingly obscure hardware and operating systems for so long before they become more trouble than they're worth. For instance, I have DOS machines sitting around to load programs like APRSdos. However, the number of hams having this kind of hardware is decreasing rapidly, as some people don't want to keep 10-year-old hardware and software sitting around. It's time to look at migrating to newer operating systems, and using technologies like USB, instead of the vanishing serial port.

Anyway, I think this is a topic that needs to be opened for a bit of discussion. I'd be interested to hear other's opinions.

73s,
Terry, N5RSE

Hot off the AP newswire. [Vicinity Corp is the company behind MapBlast which serves the maps used by Findu.COM]

Microsoft to Buy Map Maker Vicinity
The Associated Press
Oct 22 2002 8:50PM

SEATTLE (AP) - Microsoft Corp. said Tuesday it plans to acquire software company Vicinity Corp., in a $96 million cash deal that may help the software giant gain greater appeal among wireless phone companies.
Under the agreement, which is expected to close by the end of March, Microsoft will pay Vicinity shareholders $3.33 a share, a 33 percent premium over its closing price of $2.24 on Tuesday.

Vicinity, founded in 1995 and based in Sunnyvale, Calif., develops software
for businesses' Web sites or call centers that give customers map and
directory information based on their location. It can send customers, for
instance, to the closest coffee shop or express delivery box, mapping the
route and providing other information such as office hours.

The company will become part of Microsoft's MapPoint division, which develops
mapping and geographic-information software for businesses, said Michael
Graff, general manager of the MapPoint business unit.

That actually has more positive potential than negative. Microsoft announced
in MapPoint2003 that it could not be used forAVL applications (in real time)
or Fleet tracking operations for over 50 vehicles in non-real time (above 10
seconds). That was because they get some data from NavTech. If they can get
their data from some place else, they may lift that restriction. As an
aside, that means that APRSPOINT cannot be used with MapPoint2003 according
to the new license.

Just a thought...

So, are we going to take up a collection (similar to the findu
replacement deal) to try to outbid them?

```
With my D700, APRS Mode TNC left side, UHF Repeater on Right Side, I find
that there is no interruption of any kind from the aprs 144.390 side when
using the UHF repeater. The only interruption I get is, of course, when the
```

```
right side is set to a VHF repeater...and it only transmits when I am
listening to it...and very briefly at that.

As far as "unacceptable" is concerned...it's only unacceptable to a very few
people. I have found virtually no D700 users who object to the short
interruption on VHF rx to tx an aprs packet. It's the whole design
philosophy, and my bet is is "unacceptable" to a VERY few people. I consider
the implementation ingenious as opposed to "unacceptable".

```
In the UK, France and Spain, check your ISS logs carefully for 1600-1620z
on the 23rd of October (on 145.825).  ISS was over you and PCsat was over
the USA and they both saw each other with plenty of overlap.

PCsat was fully configured and working well.  Many packets were
transmitted with dual hop paths.  But we saw no packets from Europe.
Maybe you saw ours?  For results of tests so far, see PCsat page below:

Some people seem to have had bad experiences with Peet, but I certainly have
not. I bought my U-2000 when it first came out, perhaps 5 years ago, it has
survived two hurricanes (including George with winds over 100 MPH at my house
for several hours) and it still works great.

Mine was the same way. There is a menu adjustment for that. The service
manual explains it. I forget (it's been a while since I did mine) the
specifics .. I'm sure there was at least one website that also explained it.
You need to make a jumper to go into the din port, shorting specific pins,
and that will bring up the radio in maintanace mode, then you need to get to
the proper menu and make the adjustment. I think each side can be adjusted
seperately.

Steve:

I just received a MIM telemetry board which I will press into service at a
solar powered amateur repeater (www.qsl.net/va3pla). Your findu web site is
crucial to supporting web based integration of repeater status. Monitored
will be voltage, current, temperature and other parameters. I don't want to
burden you with any requests until it is operational in some form on the
bench. Since the topic has come up in the group, this is a "heads-up" that
the interest is definitely there.

One of the ideas I considered with was to have them be parameters to the
cgi...it would be long and ungainly to type, but would allow people to have
a
link on a web page to show off their data. This would do nothing for on the
air
clients though.

```
I have some county maps for the Dallas area.  The map list in WinAPRS shows
the following for the Dallas map:

dallas.map      Dallas  Sproul  234522  24047   TGR     1.00

I gather these maps were generated from Tiger data by the Sprouls back
before fire was discovered.
```

Does anyone have the capability to make these maps in this format? I like
the simplicity of the maps but would like more up-to-date data.

Thanks for any help!

The ways I currently know of to use newer maps:

Windows:
  Use APRS+ and Street Atlas 9 (not deluxe!)
  Use WinAPRS with Precision Mapping maps
  Use APRSPoint with some Microsoft map package (can't remember)
  Use Ui-View32 with Street Atlas

All of the above options cost a few $$.

Linux/Unix/Mac OSX:
  Use Xastir w/Shapelib library. Download the Tiger2000 map files
  for the areas of interest from GeographyNetwork.com (in Shapefile
  format). Xastir can use them directly. This option costs $0.00,
  including all of the maps.

Some confusion on the model. This is the TS-2000, not the B or X.

TS-2000
TS-2000B (Computer Control only, no display)

TS-2000X (includes 1.2 Ghz)

I am selling the TS-2000. I have added the DRU (Digital Recording Unit)
option.

Hi there,

Someone on this list asked me about how to increase the power of a Cybiko through software, but I have lost the name and email address of this person. I just put UI Power on my website as Open Source under GPL to demonstrate how this works. The application can also be used to run other applications with a higher level of RF power.

I apologize for the intrusion.

Thanks! I can't keep all of the Windows stuff straight. I'm only somewhat familiar with one of them (APRS+).

Note also that the Xastir/Tiger-Shapefile map option doesn't use "special" (by that I assume you mean captured images) maps either. They are vector maps with full street-level detail. It stitches them together nicely. It tiles USGS topos into a contiguous map also, but in that case they _are_ images (geoTIFF).

If you really want to have fun, invoke the terraserver option (satellite images), overlay radar images on it, and plot APRS stations and weather info on top. We just added wind barbs and hurricane wind radius plots to the mix. I'm watching hurricane kenna right now, which is about to hit the Mexico coast. Predicted wind velocities of 178mph. Wow!!!

Hello all,

If this has been covered before, sorry, I didn't see it.

Has Findu been used to create a map of every point (with a set radius) that it has received data on. I would be interested in one of my region, say 200 miles in diameter, to show where digi coverage could be improved.

Just a thought.

73,
Chris (KK5XF)

I wrote a perl script a while back that would snag all of the packets from the internet stream, convert them to a lat/long, and then save the unique ones in compressed object APRS format. I could then import the many thousands of objects into Xastir and see on a map where posits came from. The Perl script threw out positions that were outside the area of interest.

What I ended up with was a road map, with only the roads that APRS'ers traveled showing up.

Yes, I did several maps like this, and demoed this on the sig, a year or two
ago. Here are a couple examples, of the US and Washington:

http://www.findu.com/wa.png

http://www.findu.com/map.png

There are problems with using this for determination of coverage though...some
of the positions you see are reported via HF, WinLink, satellite, from aircraft,
or the result of unusual propagation.

These maps take a while to generate, and would never be available as a URL for
people to ask for on the fly.

Does anyone know where this data stream originates? I would like to
connect to the source and pull this data without all the aprs stations.

The data I am referring to is the nws warnings that allow the county maps
in winaprs to change color depending on the warning type.

I could enable "direct stations only" and do the same thing, but I don't
need all the national aprs stations coming in.

ISS/PCsat test:

I got this email today from K7FZO who not only got many double-hop packets
through ISS and PCsat but holds the DX record for a double hop too....
while driving!   de WB4APR

---------- Forwarded message ----------
Date: Thu, 24 Oct 2002 13:29:22 -0700
From: Thom Proehl (K7FZO)
To: WB4APR@amsat.org
Subject: RE: K7FZO 1880 mile DX

Bob, It was very exciting to see my call sign come up on your PCsat site

as a new DX record for Oct. 22nd. What makes it even more fun was that I
was mobile in heavy traffic trying to figure where both birds were from my
PocketSat software on my palm and making path adjustments on the fly. Fun
stuff!!!

I have been play'n around with APRS for almost 10 years but this is new to
me and has become the most exciting and interesting part of the hobby I
have found.

It's a thrill to be out hiking in the Cascade mtn's and bounce a packet or
two off the space station and know someone might see my position at some
secret fishing lake. This Winter and next Summer I'll try this again
during some longer back country trips in the mountains.

Thanks again for... making this an exciting hobby!

Cheers, Thom K7FZO

This is NO GOOD for us folks up in Canada

The ONLY mapping package that has half decent maps of Canada is Mappoint or
Streets & Trips
I understand this works with AprsPoint. I guess I'll have to have a look at
this package

What I want to know is:

WHAT happened to all the ZIP files of COUNTY maps?!

I had a HD crash months ago, reloaded everything only to
find; too bad, all the county zip files GONE!

??

DON'T tell me: FTP://APRS.RUTGERS.EDU cuz
THAT'S been DEAD for OVER 6 MONTHS!

I believe it is Dale Huguley that is snagging this data from the
EMWIN? data stream, doing the conversions into APRS alert format and
putting it out on the stream for all of us to see.

He appears to be a subscriber to this list as he has posted here
recently.

I have software called DXF2MAP which will convert the MAP files to and
from DXF format, that can be read and edited by many cad packages.

Let me know if you want a copy... I think it is almost time to make the
software open source :-)

467. [aprssig] Digi coverage in South West

From: "Vic Fraenckel" <vfraenc1@nycap.rr.com>
Date: Fri, 25 Oct 2002 15:47:49 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-104446-2002.10.25-15.31.17--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I was recently (Oct5 - 7) part of a chase crew for a manned gas balloon that
was participating in a long distance race out of Albuquerque, NM. All 15
balloons were caring APRS Tracking packages. I was able to track all
balloons up thru central and NE New Mexico and on into the Texas and the far
Western Oklahoma panhandles. After that we were unable to track any balloon
save ours (we were never more than 20 or so miles from it) as we apparently
got beyond the direct radio contact with the other trackers. I was curious
to know what digi coverage was out there in the OK panhandle. Is there some
sort of coverage chart/map available that would help me see the coverage in
the area of OK, KS and NB? My mobile APRS tracker was a D700 and I was
running APRS+ on my IBM Thinkpad 770.

BTW: most of the balloons flew above 3000 feet most of the time wiith some
ranging as high as 10-12000 feet.

Any enlightenment will be appreciated.

TIA

Rendered body type: text/plain

```
THere are only 3 days left in this joint ISS/PCsat test.

There have been 14 successful dual hop packets, but all from the USA where
it should be hardest due to QRM.  THere are many opportunities occuring
elsewhere around the world and especially for isolated stations or coastal
stations.  Just set your UI digipeater path to go to UNPROTO CQ VIA
RS0ISS,W3ADO-1 or the reverse, depending on which one is in view of your
station.

Gil Carman produced the following JOINT visiblity times and the distances.
So far DX packets have been successful at separations of 1880 miles.
To use this list, just look for ANY times below that occur when either ISS
OR PCsat are in view of your station.  One note, PCsat must have been in
Sunshine for at least 15 minutes or it does not have enough power to
transmit.  (It doesnt work at all in the dark)..  de WB4APR

Hint:  The ones with the closest approach are also the longer periods, I
had to leave off the end of the window column to fit email.  You can
estimate when the window closes as the same time from the window opening
to the closet approach.  I have marked the ones I think have great
```

potential:

```
    ISS/PCsat line-of-sight windows

    window opens          closest approach

470. [aprssig] RE: Uncorrelated MAYDAYs

From: Bob Bruninga <bruninga@usna.edu>
Date: Sat, 26 Oct 2002 12:13:30 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-104534-2002.10.26-11.56.35--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

APRS DF applications:

A lakeside Coast Guard group wants to use APRS for localizing MAYDAY calls since the super-dooper-automated millions of dollars sDF ystem is not doing a good job.

They are looking at the APRSdos OMNI-DF technique which simply localizes the originator by who HEARS and mostly who does NOT hear the call. The OMNI DF technique is perfect for this. See

  http://www.ew.usna.edu/~bruninga/dfing.html

Here are some exchanges with the group. Just thought it was worthy of posting to the group. There is so much of APRS we are not using...

On Sat, 26 Oct 2002, Scott wrote:

Sure, a voice report comes in from DF1 station. In APRS dos, hit these keys:

```
     O F DF1 <CR><CR>               (OPS-FIND station "DF1")
     E D 1   <CR><CR><CR>           (EDIT DF select 1)
     9       <CR><CR><CR><CR><CR>   (Enter signal strength reported)
```

And with only those entries his data is in the system for all to see.
To see a plot of the overlaping signal strength contours of alll station reports hit "M P D O" (MAPS-PLOTS-DF-OMNI). The source of the signal is probably in the area nearest the intersection of the most brightly colored contours which are NOT overlapped by the large BLACK "NOT-HEARD" areas.

The key to the sucess of this system is getting the reporting statiosn to have a good understanding of their PHG with respect to how good they can HEAR.

471. [aprssig] New Satellite Data Server on APRS-IS

From: "Michael J. Wolthuis" <wolthui3@msu.edu>
Date: Sat, 26 Oct 2002 16:49:50 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-104564-2002.10.26-16.34.40--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Everyone,
I know that a Sat server with filtered data used to exist and I have
missed that for sometime, so I have recreated the wheel and made another
SatGate server.
Here is the info and how it works:

SatGate server is located at igate.miaprs.net
Running: APRSd 2.1.5b9
Ports:
14601   status
14679   Grand Rapids, MI Sat Data as heard on local TNCs,
currently tracking PCSAT and UO22
10251   full worldwide Sat data feed as received and filtered
from first.aprs.net
10252   Same as 10251 without history

Here is how it works currently:

The SatGate connects to an AFilter machine that filters data from first
or second depending on where connected
it filters for W3ADO,PCSAT,ARISS,UOSAT5 and others as need to be added.

Then clients can connect to the SatGate on 14679 for local Michigan Sat
data or 10251 for the filtered worldwide Sat feeds.

***Note, filtering is not perfect, but I am attempting to monitor it and
regulate the filters as needed. Possibly other filters need to be
added, but it works
good at this time.

If anyone is interested please connect up and check it out. I leave an
Xastir client on logging 24/7 to get local Michigan sat data on 14679.
Currently the connection limit is 40 systems, we will see how the
bandwidth goes.

Feel free to use clients, link up SatGates that feed data, but do not
want the full APRS stream down, etc.

Questions, feel free to email me directly at wolthui3@msu.edu or on this
list!

Enjoy,
Mike Wolthuis

I've updated the APRServe.txt file on my website to include your info. This file is located at:
   http://members.aol.com/wa8lmf/aprs

and is formatted for immediate use with APRSplus, and with WinAPRS by doing some find/replace editing. As usual, any submissions, updates, etc are requested.

Take a look and see if this looks correct. [I assume this is a new server not connected with the East Lansing MSU APRS gate/server...]

Rendered body type: text/plain

Hi.

I'm writing this on behalf of a couple of local hams that don't have convenient internet access.

Both have Kenwood D7's and use them occasionally for APRS. Our club will be providing communications for the local Santa Clause Parade and they both want to use they're D7's for voice and APRS. Since I don't have one, I haven't had too much luck helping them out.

Can anyone on the list give me a set of instructions for configuring these radios for use on a standard voice repeater and have them periodically beacon an APRS packet? Both radios are about a year old so there shouldn't be any question about firmware ..... I imagine.

Thanks

Bruce - VE5BNC

Rendered body type: text/plain

Is there a version of the FT-1500 that had a DB-9 data connecter as opposed to the DIN that my FT-1500m has?

If so...and someone on-list has a manual... could you tell me what signals are on what pins of the DB-9... and what model that was?

It's a long story. :o)

Ev, W2EV

Why don't I see any APRS stations in Alaska on the IS? Is there APRS
infrastructure up there?

Eric,

According to db.aprsworld.net there were 164 packets with Alaska locations
heard in the last 24 hours.

For US statistics take a look at:
http://db.aprsworld.net/stats.log.php?file=states

World statistics:
http://db.aprsworld.net/stats.log.php?file=country_col_region

Note that some of those countries could be represented by satellite objects
way above the country. I suppose I should filter those out :-)

These statistics are generated every morning at 6:00AM central time.

Never heard of an FT-1500 with a normal (for serial data) connector on it.

Are you referring to the RS-232 CAT data in/out connector that is on a
pendent cable, or the "packet" connector (that is actually audio in/out/PTT)
jack on the rear panel?

If it's the former, my guess is that someone got fed up with the wierd
connector for computer interface/CAT applications, chopped off the min-din
and wired a DB-9 with standard 232 pinout on instead.

The Yaesu FT-2600 and its Vertex counterparts is the only group of
transceivers that I know of that have a "DB-9" connector for the packet
port.  The 2600 has been dogged with reliability problems, especially an
annoying problem of losing it's memory every now and then.   Some people
have attributed this to spikes on vehicle startup and hot mic picking up
DTMF, but everytime someone says they've figured it out, someone else comes
along where those circumstances don't fit with the same problem.  Yaesu
denies the 2600 has any problems, but check the usegroups and eHam.net and
you'll see that's not the case.   And everytime someone says the "new"
```

version has fixed the problem you find a group of people with "new" radios
having the memory problem.

Although, I've never owned a 2600... I really wanted to buy one, but based
on the extreme number of people voicing complaints on it, I'd be very leery
of purchasing this particular model.

73,

Mark

Just realized I was talking about the FT-100 "DC-light" (160M - 70cm) 100W
minimobile, not the FT-1500 2M-FM-only 50W micro-mobile you were referring
to.

My FT-1500 has the usual 6-pin mini-DIN "packet" (actually RX audio out\TX
audio in\PTT) connector that most recent radios (including the FT-100) have.

[The FT-100 DOES have a second mini-DIN dangling on a 5" pendent from the
rear that actually is serial data in/out for "CAT" remote frequency control,
or that can be software switched to an amplifier control interface.]

You actually have an FT-1500 with something else on the rear panel?? Does it
otherwise look like the usual FT-1500m?

Stephen nailed it...but with a different twist (which is why I kept the Subject header as is).

I was asked to troubleshoot a cable between (what I was originally told was) an FT-1500 and a KPC3plus. When I got the cable, I was suprised to see a DB-9 instead of the DIN6. That is what drove my asking if there was a version of the -1500 that had the DB9.

As it turns out, it IS an FT-2600 and NOT an FT-1500 after all.

Sorry for the confusion, but I deeply appreciate the willingness of others to chime-in to help.

Warm regards,
Ev, W2EV

. The 2600 has been dogged with reliability problems, especially an
> annoying problem of losing it's memory every now and then.

Yup; I'll attest to THAT, however:
I solved the problem myself.
If you need a radio for HOME use, that sits on the shelf, THIS is the one.
I have mine wired out the back panel (DB-9), and it's on the local BBS frequency 98% of the time.
As long as the radio is operating from a POWER SUPPLY, I have NEVER had ANY problem with it.
(mobile is another question, I have constantly had that power surge/memory problem)
If you don't try to run the radio on the 60W power level, there's pretty much no problem with the radio, but since I left mine sitting on the shelf here, mine works just fine.
I have left it on 24/7 for months now, ever since I aquired a HUGE capacity battery & float charger, and it basically hasn't been off for over four MONTHS without ANY problems what-so-ever.

Rendered body type: text/plain

I have had a FT-2600M for over a year and never had a problem. Running 24/7
APRS. Same with a FT-1500M also running APRS.

I am not sure of the panhandle, but from I-35 east, you should have had
digipeater coverage in OK. Did you set the balloons to digipeat too, or were
they simple trackers? Your balloon would probably have heard all the others...

Rendered body type: text/plain

This config seems to be working well. This new server is a bi-directional
server, which means that data will be passed to and from the clients and
the servers. There is still a uni-directional SatGate port on
aprsca.net:10150 for clients who do not want data to be fed back to them.
With these two ports, you all should be able to find the best match for you
and your Satellite operations. Enjoy! 73s

Really, any of this should be inconsequential. I'm wondering why there isn't a version of Delorme Street Atlas or some other "local" mapping software running on the findU servers that can serve up the local maps. In case all internet map servers go away, this might be a good thing to explore for a "backup" (pass the hat, Delorme costs about $50 I think).

Speaking of internet generated maps, I have found that it is possible, at least for the time being, to keep up with MapBlast changing the URL to their map servers. It's too bad WinAPRS isn't being updated regularly to fix this and other bugs that I and others have reported. Oops.. topic for another thread. Enjoy your APRS! 73s

First, read the license in DeLorme...it is very restrictive, you cannot send the maps to others on the internet. Next, it runs under Windows, while findU is under Linux. Then there is a matter of horsepower, it typically takes a second or two for a mapping application to generate a map, findU at peak times needs several maps a second. Next, findU is a world-wide system, any solution requires maps for more than just the US. Finally there is bandwidth, the DSL line findU sits on cannot handle the upstream volume a map server would need.

If you look back a couple months ago on the sig, there was a big discussion of these issues and the various alternatives.

It is not inconsequential because some of these companies differentiate between local usage (such as a CD-ROM) vs. global useage (internet) in their license

agreements. Sure, you could do it, but for how long before their lawyers cover
you in paper?

Ah, you are correct - my mistakes. I keep forgetting that findU is
worldwide. I did read my DeLorme license, it would be hard to get that to
fly anyway. Well, back to the drawing board - if MapBlast goes the way of
the winds as far as free mapping, there will be a solution somewhere. 73s

My two digis' have been running over 2 years with nar a hiccup using the
2600's. I have a total of 5 and no problems.

The majority of the memory problem stemmed from folks turning on their car
with the radio turned on and the voltage drop killed it. The 2600's seem to
be more susceptible to this problem.

maps.aprsworld.net provides street level mapping for the continental US ('in the process of adding AK and HI) in < 0.5 seconds per map. I'm doing this using entirely open source software (linux, php, mapserver) on a single processor Pentium III. These are the maps you see whenever you visit aprsworld.net and click on "Enable Maps". The API for creating your own maps is listed at:

http://db.aprsworld.net/datamart/api.php

You can also do cool things like have an URL that will always provide an image of your last location (complete with APRS icon) and another image that shows your status information. These can be emdeded in any web page anywhere on the internet.

For details on how to do this see the API documentation or read the "News" page at:

http://aprsworld.net/info/news.php

As Steve pointed out, US only maps do not address the needs of everybody. maps.aprsworld.net can handle any maps in shapefile format. If you have such data for your area please contact me and we'll integrate it.

When I try this on stations in my area I get a response time of 3 to 5 seconds, any reason why it would take so lonf for South Florida? Do you have any scales available between "regional" and "street"?

The problem is very few countries have public domain street level data as the US does, when data is available it is very expensive....

Initial maps for a new area take a little bit longer to generate because the
map data is probably not in cache and they have to be loaded across the LAN.
You will find that looking at keys now it will load much faster.

You can use the extent scale and specify your own extent using
minx,miny,maxx,maxy. There is also a "town" scale which is probably what you
are looking for. If you have any other scales you would like defined let me
know and I'll add them.

I purchased ESRI's Digital Chart of the World which has highway level maps for
the world. They are in e00 format. Using ArcInfo I can convert them to shp,
but I do not know how to do a batch conversion. Are there any GIS people out
there that can help me do a batch conversion?

Just a thought, but Arcview DOES have worldwide map support as part of the standard package. I'll have to look, but I believe the resolution should be find for our purposes, although I'm fairly certain it won't be "street level" off the distro CD's. But good enough for county/state/country/region. Without having read the license yet, we probably can't just serve maps online, but why not contact ESRI with our map requirements and see what they can do? They're very accommodating folks, and they do know maps!

If someone can give me the exact specs of what will be the ideal solution I'll be glad to contact them.

73's
Ray - WB3ABN
Kingston, WA

<big snip>
As Steve pointed out, US only maps do not address the needs of
everybody.
maps.aprsworld.net can handle any maps in shapefile format. If you have
such
data for your area please contact me and we'll integrate it.

Ray,

That's the maps I have. The license is even suitable for this project. The only problem is that they are in e00 format and I need to convert a few thousand of the files to shapefiles. I now how to do this from the arc console by hand, but I do not know how to write a script that can batch convert all of them at once.

Curt is my hero! I've been looking for this sort of utility for a long time. I
did a search again and it seems that a sourceforge project released e00toshp
on 23 Aug 2002. And it works. I just converted a highway map of Iceland from
e00 to shp and it appears to be flawless. I wish I had run accross this
earlier (especially since I wrote and released my own sql2shp which they also
appear to have one of).

This is great news. With some luck I'll be able to get highways for the world
online within a few weeks. Unfortunately they do not have name labels, but
they are better than nothing.

wohoo!

Although the 28th was the scheduled end of the joint IAA/PCsat test, at
1940z, ISS was still on 145.825, so if there is a joint visibility pass in
your area, please try a double hop test. Here are some more predictions:

507. [aprssig] 30M HF APRS Freqs -- Warning: Long Discourse

From: WA8LMF2@aol.com
Date: Mon, 28 Oct 2002 19:22:25 EST
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-104740-2002.10.28-19.05.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Once again, a post on another APRS mailing list has indicated the confusion
and general cluelessness surrounding SSB frequencies and how they relate to
tones generated by packet devices on HF.  I am repeating my response to that
post here for general information....

> Well, it depends on if you are using LSB or USB...  But you are
>  right, 10.152 MHz LSB is the HF APRS frequency...

[ WRONG for any commonly used TNC or other device on 30M APRS ]

Simply quoting the dial frequency is absolutely meaningless unless you
qualify it with  the audio tone freqs being used by the TNC or other device.

The 10.152 suppressed carrier ("dial" frequency on LSB) is two khz OUTSIDE
the amateur band (10.100.00 to 10.150.00).  The supressed carrier frequency
is NOT transmitted.  What IS transmitted are sidebands that are offset below
the carrier freq on LSB (or above the carrier on USB) by the exact value of
the AUDIO tones fed into the radio.  Unless you are using high audio tones
(like a PK232 generates; ie 2110 Hz /2310 Hz)  you will be transmitting
sidebands OUTSIDE THE BAND ! ! !

Since the actual transmitted RF frequencies (on lower side band) are the
indicated suppressed carrier frequency (i.e. "dial frequency") minus the
audio tone frequencies, the actual dial frequency you want WILL DEPEND ON THE
PARTICULAR AUDIO TONE FREQS your particular TNC or other device produces.

The ==ONLY== constant is the ACTUAL RF freqs of the 200 Hz shift mark and
space tones on 30M APRS.  They are:
    10.149.200
    10.149.400

To produce these RF frequencies with a KAM or TNC2 (300 Baud HF mode) whose
default audio tones are 1600/1800 Hz, you must set your radio to 10.151.00
LSB:

   10.151.00 - 1.800  =  10.149.200
   10.151.00 - 1.600  =  10.149.400

Or set the radio to 10.147.60 USB:
   10.147.60 + 1.600  =  10.149.200
   10.147.60 + 1.800  =  10.149.400

To produce these RF frequencies with a PK232 whose default audio tones are
2110/2310 you must set your radio to 10.151.51 LSB:

   10.151.51 - 2.310  =  10.149.200
   10.151.51 - 2.110  =  10.149.400

Or set the radio to 10.147.09 USB:
   10.147.09 + 2.110  =  10.149.200
   10.147.09 + 2.310  =  10.149.400

To produce these RF frequencies with a TigerTrak whose 300 Baud/narrow shift
audio tones are 1100/1300    (weird pairing centered around the 1200 Hz low
tone for 1200 baud packet -- but actually very nice because the tone pairs
are in the dead center of the typical SSB filter bandpass and suffer the
absolutely least amount of phase and group delay distortion)    you must set
your radio to 10.150.50 LSB:

   10.150.50 - 1.300  =  10.149.200
   10.150.50 - 1.100  =  10.149.400

Or set the radio to 10.148.10 USB:
   10.148.10 + 1.100  =  10.149.200
   10.148.10 + 1.300  =  10.149.400

Note that some HF radios with "DATA" or "FSK" modes offset the indicated dial
frequency to correct for the difference between the suppressed carrier freq
and the actual mark or space frequency, typically assuming the lower tone is
2125 Hz or sometimes 1800 Hz.   Hz. This will force you to compute offsets
different from what I have listed for LSB/USB.

AGAIN: Quoting "dial frequency" alone is ABSOLUTELY MEANINGLESS unless you
qualify it with mode (USB/LSB/DATA, etc) and the AUDIO tone freqs in
question.

ARGH! Thanks.
That is on my home computer. I will try to kill that message tonight..
thansks for the reminder...

But it does show you if the IGate operator in your area has enabled the
generic "SCOUTS" for local RF.

Bob

Rendered body type: text/plain

> Excellent Dual hop pass USA to europe.
> Check your logs around 1830z to 1840z!

Here are the double hop packets I captured in Maryland:

```
[13:26:08] K7FZO-1>4W3YTY,RS0ISS,W3ADO-1*,SwATE,WIDE/1:'2`]l!Kk/]"56}...
[13:26:35] K7FZO-1>4W3YTY,RS0ISS,W3ADO-1*,SGATE,WIDE/1:'2`^l!Kk/]"58}...
[13:26:36] WA6LIE-3>AP30,RS0ISS,W3ADO-1*/1:;ISS_ 298
[13:27:22] K7FZO-1>4W3YTY,RS0ISS,W3ADO-1*,SGATE,WIDE/1:'2`^l!Kk/]"57}
[13:27:53] K7FZO-1>4W3YTY,RS0ISS,W3ADO-1*,SGATE,WIDE/1:'2`]l!Kk/]"57}
[13:28:00] K7FZO-7>4W2WYS,RS0ISS,W3ADO-1*,SGATE,WIDE/1:'1Dol [/>Thom's D7
[13:28:43] K7FZO-1>4W3YTY,RS0ISS,W3ADO-1*,SGATE,WIDE/1:'2`]l!Kk/]"5;}..
[13:33:10] N0AN>CQ,RS0ISS,W3ADO-1,SGATEW-9*/1:=4205.50N/09400.75WShasan
```

Tom K7FZO again made it from Redmond Washington with his D7 HT and D700
mobile! Then W6LIE fom SoCal and then N0AN, Hasan made it from Iowa. It
is garbled, but it came via W3ADO-1 which was the only bird I could see at
the time, so it had to come through RS0ISS first.

Did anyone get any others? My clock above is within 1 sec of UTC.

On the subject of publicly available map data ... I was at the Longeuil
(Montreal, PQ, Can) Hamfest last weekend and spoke with Michel  Graveline
 (VE2WMG) and Denis Graveline (VE2DNG) and they said that Canada has finally
begun releasing mapping data. Its a bit pricey and only a few regions
available, but they are putting together maps UIView maps based upon it ...
What I saw looks pretty good ...

 cheers ... 73 de brian, n1bq

Recently the author of a shareware SSTV program I own (WinPIX 32) died,
basically making my software an orphan with no hope of future upgrades.

This got me thinking about the various APRS programs. Except for the open
source Linux-based Xaster, all the other APRS programs (DOSaprs, Win/MacAPRS,
APRS+SA, UI-View, and APRSpoint) are the intellectual property of individuals
who have kept the source code private.

Have the authors of any of these programs made provisions for the transfer of
the source code to some other individual or organization if they die or are
incapacitated??

APRS+SA is written in APL, specifically, APL+Win:  http://www.apl2000.com.    APL+Win is semi-compiled.
  APRS+SA is supplied uncompiled; the semi-compilation is performed at runtime. It is supplied
uncompiled to save space in the distribution files.   Once compiled, program functions run faster than
simple statement interpretation.  The "workspace" of APRS+SA is an APL "runtime" workspace.  However, I
supply APRS+SA as an "Open Runtime".  This means, the program will run on a runtime interpreter
(aprsplus.exe) or, on any APL+Win development system of the same version number as the runtime that I've
 targeted it for, specifically,  APL+Win v4.0.  A unique feature of this programming environment is that
 one can change most functions on the fly.  In fact, during development of APRS+SA, I usually have the
program running while it is being edited.  Edited code is applied immediately, and semi-compiled the
first time it is called.  No build is necessary.  But I digress.  In answer to your question, any
programmer with the APL+Win development environment, can load the APRS+SA runtime workspace, and edit
any function.

If you are going into the rear panel "packet" jack, you have to have a fairly
high level (200-300mV -- similar to home audio-video Line Level).  The
standard output level of the KPC3 is intended to go into mic jacks whose
typical sensitivity is more like 5-20mV.

If you have the pre-plus KPC3, a movable attenuator jumper inside the unit
selects either low or high-level TX audio output which is then fine adjusted
with a hardware pot.   The KPC3+ has a software-controllable attentuator that
can adjust the output from 1mV to 4 volts using the CAL or XMITLVL commands.

Several times I have emailed you an updated icon set for APRSplus after the
mailing list discussion on this issue last summer.

I haven't heard anything back. Did you ever get the updated symbol set I
made?  It included new icons in positions for P53 (Colorbar TV symbol for
ATV/SSTV) and S44 (Kenwood Logo).

Did my mailing from this AOL address possibly fall victim to the IP
blocklists that are part of the anti-spam wars now raging between ISPs ?

I'm not sure of anyone else, BUT:
I REPEADEDLY receive garbage emailed virus attachments
of apx 130/150k SEVERAL TIMES A WEEK.
It appears to be from someone who has gotten addresses through the SIG (so it appears).
Anyone else getting this ----?
Most HAD CALLSIGNS attached to the message, usually in the SUBJECT line, but now they've gotten " wise ", and don't do it....hard to miss an email of over 130k in you server " In " box.

I had a similar problem with the TTII until I fed the audio directly into the mike connection. No problems after that.

> Most HAD CALLSIGNS attached to the message, usually in the SUBJECT line,

What you are describing is the behavior of the Klez and BugBear worms.

Anyone who has ever posted on the list will have their address somewhere on the harddisk of nearly everyone else on the list. All it takes is for one member of the mailing list to get infected. These worms randomly harvest email addresses from anywhere on an infected machine (i.e the Recycle Bin, the deleted emails folder, strings of the form someone@somewhere.com in Word documents, etc as well as the infamous Outlook address book). They then send themselves out with these addresses either in the TO: field, forged in the FROM: field, or both.

Most users don't realize that the FROM: field of an email is completely untrustworthy (it is trivial to forge and proves nothing about where an email actually came from) and dont realize that they need to display the detailed routing headers to discover where an email REALLY came from. They start blaming all manner of innocent bystanders (whose only "offense" was having their message read by someone else!) for "sending them a virus".

[What I was referring to in my original post about "collateral damage" is something else entirely.
In the escalation of the anti-spam war, many ISPs are now simply blocking (refusing to receive) ALL email coming from sources (either by domain name or by IP address) that are known to be major spam sources. This is an effort to force the sending ISP to clean up their act and evict spamming tenants. Usually this is done by using "block lists" generated in near real time by people reporting "spam received". When the domain or IP address of a spam-friendly ISP winds up on such a list, increasingly innocent bystanders are finding their email getting blocked for a while also.

An example: Recently AOL started blocking ALL mail from Telia (a major Swedish Internet provider responsible for a large percentage of all Internet accounts in that country) because of the massive amount of spam forwarded through insecure mail servers at, and spamvertised websites hosted on, Telia. The resulting flood of complaints from other Telia users who suddenly found themselves cut off from 1/3 of U.S. email addresses forced the outfit to crack down on spamming, clean up insecure mail relays and kick numerous spammer websites off their servers.]

This may sound like a DUHHHH, but have you
adjusted the output of the KPC-3. There are two
output levels on the KPC-3 controlled by jumper and
a pot for fine adjustment for 3 kHz deviation.

My FT1500 has low transmitted packet audio. I tried 3 different KPC3's. All
sound the same.
has anyone else noticed this?

Bruce
Check the radio setting to see if it's set in narrow or wide, I don't
know if the setting is for audio only or if it also changes the
deviation of the packet din output.
My guess, if affects both.
I the default setting is wide.
Randy

>
I set up a modified version of the find cgi to use your maps with the three
available scales...they don't exactly match the ones used with the MapBlast
version, but they do allow a general comparison:

http://www.findu.com/cgi-bin/find-us.cgi?call=k4hg-8

If you want to explore different areas, a quick way is to do:

http://www.findu.com/cgi-bin/find-us.cgi?call=*

which shows the last few seconds of reports, and click on the callsigns...

I have a copy of Spam Assassin if anyone wants it. Its freeware and you can
download it as well. It looks for tags and you can set it to delete the mail
form the server so you never receive it in the first place. It can be
configured in a number of ways to the regular mail on your lists goes
through.

How does WIN APRS pull data from the street atlas program? I am trying to find how as I am working on a way to maybe use the same process in the APRS CE program with pocket streets maps so the CE community can have street level mapping without having a full sized laptop. Any information that I can get will be great!

Thanks
Peter

Hi Steve,

Looks fantastic! The API is not set in stone, so if you have any suggestions for improvements let me know.

I'm working now on getting 1:1M scale highways for the world. As we've discussed before, that is about the best data cheaply available with world-wide coverage. It will look okay for regional scale and larger scale maps, but will not look right at all for smaller scales.

That was the point of having someone else set up the backup findU server. findU is different from the client programs, in that the process of maintaining the server is more important than the source code itself. If I had taken the collections and handled the new server myself, it would have been up months ago, but the process of installing all the pieces and getting it configured correctly is difficult to learn, and the designated party seems to be having free-time issues. He has had all the pieces needed to get the parser running and the database working for a month, but apparently has not had time to do this yet.

what's even cooler,

Is "Mail Washer"

It will do the same thing as below, but with an added twist.

You can even send a "Bounce" back to them. It looks as if you address is no longer any good or no such user etc.

My E-Mail load has dropped from 200-300 a day, (100 spam) to only a few spam at all.

Joe

As a "Mail Washer" user, I would offer a suggestion.

You may want to check with your service provider
to see what kind of problems you may cause them.

The program lets you look at your mail while it is
still on the server and lets you decide which messages
to "Bounce" or "Delete".

The problem develops with the bounce of your
bounce. Since a lot of the SPAM does not have
a valid return address this will create a return
message from somewhere upstream. This return
message will be sent to your ISP since that is
what "Mail Washer" fakes as the sender of your
bounce.

One person at my ISP must manually delete all
these messages that us "bouncers" are causing.
So far they have been very nice once they
understood why there were so many bounces
with my address somewhere in the message!

I even had a message from a SPAMMER who
wanted to know why all their messages were
bouncing. Of course, I bounced that one too!

Hershel

Ive used it for months, its great and free. After your blacklist gets
filled, you get a lot less Spams, RTFM and it works great. I'd give it an A+

>You can even send a "Bounce" back to them. It looks as if you address is
>no longer any good or no such user etc.

I'm not really sure that this does much good. As Hershel points out many of the return addresses are no good anyway. Additionally, when I was a mail system admin I continued to get messages for at least a couple users that had left the company some time before. I know our server was sending bounce messages but spammers (a) don't get them, (b) ignore them, and (c) never clean up their lists. They happily sell and trade them amongst themselves and quality control isn't a big priority. The priority is number of addresses.

Personally, Mail Washer is working pretty well for me, but I've turned off the bounce messages everywhere I can.

I will mention that the checks of the realtime blacklist servers seemed a little flakey so I turned them off. I'd see 4-5 messages in a row from the same person to the same list and one would be tagged. It definitely found some real spam that way, but found some it shouldn't have too. (One of the nice things is that you can review what it's going to do before it does it.)

In fairness the built in identification filters are rarely wrong so it may be the realtime servers that are flakey.

In answer to another question that was posed... You can add individual users or wildcard expressions to either the blacklist or friend list. i.e. You could add *arrl.net to the friend list.

Bill

Just to add another twist to this thread....

Have another email address, like myname@yahoo.com or myname@hotmail.com. Use this email address for those situations you don't feel comfortable with leaving your primary email address, and let the spam build up there.

Brent will probably answer this more completely, but SA is run in a separate window, and APRS+ uses interprocess communications to talk to SA and feed it with the APRS data. Thus, it is not integrated as a single application.

548. [aprssig] APRS/PCsat talk at Ga-Tech ATLANTA

From: Bob Bruninga <bruninga@usna.edu>
Date: Thu, 31 Oct 2002 21:20:32 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS SIG <aprssig@lists.tapr.org>
Message-ID: <LYR842-105169-2002.10.31-21.04.00--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

If anyone in Atlanta is interested on Monday night, 4 Nov, WB4APR will be giving a Talk/Demo at the Ga-Tech IEEE and Radio Club W4AQL on PCsat and APRS related topics.

The organizers say:

" Non-GT visitors are more than welcome at the IEEE/W4AQL event. I hope to see you there. And please invite your friends, if they might be interested. Turnouts are hard to predict, but the more the better. We should have a sufficiently large auditorium."

Dont ask me any other details, but for the 1911 EST pass we should all be in a EE Dept parking lot somewhere... I hope you can find out local details on the local repeaters, I will be at GA-Tech all day Monday hanging around waiting to see where the meeting will be..

I havent been to Ga Tech since I graduated in 1970, so I would hesitate to tell anyone how to find the radio club or EE building now 32 years later...

Good luck.
de WB4APR, Bob

```
My home station (KB9WVG) is running aprspoint and sending packets to RF.
These packets are received just fine by my D7 (KB9WVG-7) and by APRS IS.
However, my mobile station (KB9WVG-14, using pocketaprs and a kpc-3+) does
not display these packets. Any ideas? The pocketaprs station is working
just fine- has been for a year. Why would it not display these apparently
good packets?

Rendered body type: text/plain

```
Having recently acquired a 100% working PDP-11/24, I'm very interested
in using it as an APRS platform (yeah, I know its a sick idea.)  I've
download the APRS spec from TAPR and that all seems straight forward.
I'll be writing the program in BASIC-PLUS under RSTS/E and then
compiling it.  The question I have is what destination code would I
use?  Would APZ011 be appropriate until a more permanent one could be
assigned?  Or would it be better to just use something like PDP011?

73 de Chris, N2UX

Here are more details:  The talk will be in the Architecture building and
talk in is on the Ga-Tech repeater 145.15 PL167.9.  Another repeater is
wide area 146.82 with PL 146.2.

Ga-Tech map.  Building is 75 or 76. Follow signs.

Yes, it is a sick idea...   Heathkit made a PDP-11-- the H11.    ;)

Many APRS applications will completely ignore packets if the first two
letters of the destination are not "AP".

[ The original intent during APRS infancy a decade ago was to allow APRS to
coexist with classic connected packet on the same channel.   APRS apps would
ignore all but packets addressed to "APxxxx" and classic packet apps could be
set to REJECT anything with "APxxxx".  ]

BTW, are you going to draw maps using ASCII "teletype art" on the PDP?.....

How about "APDP11"  It would be a "legal" APRS path and get the computer
model number in...

radio is turned on.  Please report any sightings on APRS to either
myself or directly to the Warrensburg, MO Police Dept., attenion CPL
Belk, at 660-747-5511.  Also alert your local police department if the
vehicle is found to be in your area.

If at all possible, keep all tracks on the vehicle when/if spotted on
APRS for potential evidence in prosecution.

Thanks, folks....NOT a happy day here....

Also, what is the SSID?  Is this the vehicle:
http://www.findu.com/cgi-bin/find.cgi?KU0G-14

If this is the vehicle, you can also do
http://www.aprs-is.net/jfindu/track.asp?call=KU0G-14&start=24&end=0
to see a live track starting 24 hours ago.

Good luck with your search.

And another advantage is that people can operate "private" nets on 144.39
using different "altnet" names that begin with something other than AP.
Say one group wants to track a boyscout event withdozens and dozens of
moving objects all over the map.  They could choose SCOUTS as the TOCALL,
and then evey other application on ferequncy would ignore their operation
and not clutter everyone else's maps.

So it was not necessarily to ignore other non-APRS packets, but to allow
for the operation of "subnets" which I call "altnets" on the same
frequency without messing up each others maps.  But some other authors
ignored this and so they capture, display and print everything leading to
map clutter...

I use the altnet feature to find out how many people are running
a particular version of Xastir on the air. Rather useful.

Actually, if I could clarify the nomenclature, let me offer this:

The AX.25 TOCALL for APRS consists of at least two fucntions.

AP**** is the Main APRS network address callsign that is used
to indicate it is a general purpose APRS packet intended
for everyone. Since the **** were available, we decided
to let them be used as a place to put in the software
version number for convenience...

So Its kind of a "stretch" to call the AP**** an "alternate net", since
of course, it is the MAIN net...:-)

So my narrow use of the term "altnet" is meant to cover any OTHER AX.25
TO-CALL that does not begin with AP... (and the other obvious ones like
BEACON, CQ, QST, ALL and the few others listed in the spec)...

Any such packet addresed to XYZNET for example, should only be displayed
by only other stations set to the SAME ALTNET of XYZNET. Now of course,
any program may give the viewer the ability to monitor any and all other
altnets, but my desire was for all software to monitor only the designated
APRS altents and to by default filter out the other ALTNETS unless teh
operator took the effort to deactivate the ALTNET filter.

What I didnt want was for all APRS softare to be given to all new users
with all filters OFF. This defeats the purpose of the altnets so that
someone who needs to p ut little X's all over his map for his own local
purpose doesnt then clutter everyone elses map on the air...

But if an end user wants to have his map cluttered by anyone all the time,
that is his choice, but it should not be the default...

Hope that helps explain the intents of ALTNETS...

Bob

Just to make things even worse, the "default" altnet must also include grid
squares and Mic-E position reports in the TO field. Sorting these out adds even
more complexity to the parsing...

We interpreted it somewhat differently. There is no filtering
unless the user chooses to do so. Once the Altnet button is toggled
and something is entered into the box, only those stations running
the same altnet will be seen.

This makes is so that the general populace could see what was going
on with the altnet. For the people running the altnet, they would
only see each other's packets, which would make their map nice and
tidy for whatever event they're working on.

If a member of the general ham public wanted to watch only the
event, they could put in the same altnet and (perhaps) turn off
transmit so as not to interfere with the event.

Ah...bummer no place to hide....:-(  There was a good reason for designing
it the way I did, with ALTNET filtering defaulted to ON, and asking other
authors to honor that..

1) In general, ALTNETS are very rarely if ever used, so having the ALTNET
filter defaulted ON as originally intended will still let users see
99.999% of what is on the air, yet let ALTNETS serve their original
putpose.

2) What I dont like about the ALTNET filter defaulting to OFF to display
of EVREYTHING is that when I start testing things and new software or
whatever (by using an altnet like "TEST"...) in my local area, I get
complaints from people that say I am cluttering up their maps and they
dont appreaciate it.

Then I have to take my time to explain to everyone how to set up APRS the
way it was designed (that you dont see junk unless it is inteneded for ALL
of APRS to see...).  I dont have time to explain this to every 20,000
operators every time I go on the air to test something locally that was
not intended for anyone to be bothered with...

The APRS filters should be in place by default.  The user can select to
disable them if he likes, but that should be a conscious choice, not
something enabled on every neophyte user that downloads an APRS program.
If authors are delivering software that displays all altenets, then APRS
does not have the intended filters in place for fullfilling the intentinos
of the sender...

we have to spend hours and hours explaining all this every time to every
```

new user... After 10 years, I'm getting tired of doing that...

I'm not sure, but further reading lends me to believe that the DigiTraveler may require an initialization string to start receiving. It probably isn't a big deal and can probably be handled in a manner similar to the TripMate.

We need someone to get one and give the SIG a detailed report.

Rendered body type: text/plain

Evening all,
I am wanting to get some information from someone that has a Doppler in use right now. I have the following setup as of right now. I have a laptop run into a D7 via serial cable. The laptop gets its GPS data from GPS PC card in the side. My question is where do I put the Doppler so I can get a reading and still send my position? The Doppler does have a serial port to be able to hook into for data readout. I know that you can't transmit into the Doppler or you fry it. Is the Doppler daisy chained somewhere into all of this? I only have one serial on the back of my laptop to be able to connect

to for data. I have tried to have the GPS run into the D7 but the map
program I am running will not read it, hence the PC card GPS. That way I can
run streets and trips and aprs at the same time and still have street level
mapping. Can someone give some input into where the Doppler fits in to all
of this?
Thanks
Peter "Dakota" Summerhawk

People

I am wondering if there is a need to publish the APRSspec onto paper? I
know it is available online, and that it is subject to change.

However it seems to be fairly stable, and is the sort of thing that I
refer to all the time. Or I would if I had a paper copy for the shack.

Would people buy a copy if it were made available? Feel free to email me
directly and I will summarise the responses.

Thanks

Darryl

Use a separate receiver for the doppler unit. An inexpensive scanner is
probably good enough.   You might want to put some kind of RX inhibit
circuit on the doppler's receiver to protect it from nearby transmitter
overload.

You are probably going to need a second serial port to make this
work. Depending on the laptop, you can get a USB to serial adapter or a
PCMCIA to serial adapter.

No one said fox hunting is cheap. ;)

Looking at the spec on this particular subject, there's not a lot of
room for interpretation, is there?  ;-)

I don't think I've visited this particular issue before since I've
been involved in the Xastir project.  Our current implementation of
ALTNET has been in there for quite a while.

If we were to change to be perfectly spec-compliant on this point
(which I still don't personally like, but that might be beside the
point), is the list of valid TO calls/other types in the spec plus
those just expounded here on the list a _complete_ list?

I think I'd be tempted to dump to STDOUT any packets that would be
filtered out at first, just to make sure that we don't miss anything
that's been added/changed since the spec was written.  Implementing
this properly and completely seems error-prone at best.

I'd also rather implement this on the display end rather than
filtering them out at the packet level.  By default they wouldn't be
displayed, but hitting a togglebutton would instantly show all that
had been received.  This togglebutton would allow operation as we
have now in Xastir.  It sounds like you're not against that, but
would like it to default to "filtering" out of the box.

> Ah...bummer no place to hide....:-(  There was a good reason for designing
> it the way I did, with ALTNET filtering defaulted to ON, and asking other
> authors to honor that..

>From the open-source perspective:  More is better, less packet
filtering (less restrictive) is better.  If maps are cluttered,
implement better display filtering, but keep all of the packets that
we know how to decode.  That's what our philosophy has been up to
this point.

> 1) In general, ALTNETS are very rarely if ever used, so having the ALTNET
> filter defaulted ON as originally intended will still let users see
> 99.999% of what is on the air, yet let ALTNETS serve their original
> putpose.

Yea, but just _knowing_ that there might be other packets out there
means that I need to see them.  ;-)

> 2) What I dont like about the ALTNET filter defaulting to OFF to display
> of EVREYTHING is that when I start testing things and new software or
> whatever (by using an altnet like "TEST"...) in my local area, I get
> complaints from people that say I am cluttering up their maps and they
> dont appreaciate it.

We got that with the "sea of blue" comments.  The firenet guys went
off the main feed for their objects due to this, which is a real
shame.  The fix for Xastir was to implement a new scheme for display
filtering, so that we can turn on/off the display of many different
```

types of things. I think that was a better solution than just making
those object packets go away. That's probably why I'm still hooked
in to the firenet system. 10,000+ stations & objects isn't a problem
for us. We see what we choose to see at the time.

There are also still ways of putting things out there that many APRS
programs won't see. Items and/or Compressed Items are one of them.
Perhaps another method would be to define one of the symbol slots as
"unviewable". This way all of the software would refuse to show it
unless a special togglebutton were flipped. Would that perhaps be
a more useful method for testing new packets/methods?

I _REALLY_ like the ALTNET as Xastir has currently implemented it,
but then again I don't zoom in regularly on Annapolis area to see
what you're doing over there.

> Then I have to take my time to explain to everyone how to set up APRS the

I would think that the instances where this is a problem would be in
the small numbers.

> of the sender...

Getting back to the public service event scenario: What about the
case where people running an event would like to knock out all other
packets that are not connected with the event, but still allow the
event to be seen by the general public? In most cases like this, the
wider the reception of these packets the better. I would think this
sort of operation would be more common than the testing scenario that
you're describing, right?

I can think of opposite argument cases too though: SAR missions,
where we'd like to be able to use the APRS infrastructure to get
packets flung around, but we'd perhaps NOT like the general public
to see every detail of what we're doing. For this case we might
have to bite the bullet anyway and switch to another frequency,
putting up our own temporary digi's if necessary for the mission.
That's the only SURE way of making sure we're somewhat unseen.

> we have to spend hours and hours explaining all this every time to every
> new user... After 10 years, I'm getting tired of doing that...

And every new coder? hi hi Perhaps the Xastir project isn't
considered new or up-and-coming anymore. We have a rather complete
package now. I'm sure there are some things that Bob would have done
differently, but we're not Bob. There are things in the spec that
we haven't done yet, but that's true of most packages that weren't
around from the APRS epoch.

I also doubt that many Xastir users have been filling your inbox with
requests for info on your experiments. They're job is to annoy me
and the other developers first!   ;-)   ;-)   ;-)   (How do you do
a big wink in ASCII?)

"Altnet" as described in the APRS Spec covers the above with the use
of the SPC"*" To call.
Stations using the To call of SPC"*" will see all the packets of the other
stations using the to call of SPC"*". These stations will not see any packets
from any APRS station that is not part of the
SPeCial event.
All other regular APRS stations will see the packets from these
SPeCial event APRS stations.

> I can think of opposite argument cases too though:  SAR missions,

> That's the only SURE way of making sure we're somewhat unseen.

In this case you would use any to call that is not SPC or any other that is
part of the APRS Spec beacon to calls.
Like for example SARMIS.
```

```
This would cause all SARMIS stations to see all other SARMIS stations and
only SARMIS stations.

The only difference  between the use of the ALTNET SARMIS and SPC"*"
above is that the SARMIS stations will not be seen by any regular APRS
station.

Looks like me that the APRS spec covers every contingency.

Let us hope we never witness the "Silence Of The Hams"

Hi.

I keep seeing USB to serial adaptor cables for sale and was wondering if
anyone has ever tried using one with WinAPRS or UI-View.  I know the HSP
cable solution would work but that's just too easy. ;-)

I've never actually used one but I have to assume whatever driver software
they have mimics a standard serial port.

Thanks

Bruce - VE5BNC

Rendered body type: text/plain

```
I have added some new capabilities to JFindu http://jfindu.aprs-is.net

When finding or tracking a station, you can now specify whether you want
to see all SSID's of that callsign or just the requested callsign-SSID
combination.

Station Find pages now sets javAPRS to track the requested station (map
moves with station).

For Station Find pages or the tracking page, you can specify that you
are behind a firewall which does not let you get a live feed.  These
pages will then have javAPRS automatically retrieve updated packets from
the server on a timed interval (user set).  This will give a
semi-realtime display without the overhead of downloading new pages or
maps.

Try the "By Station" form to see how to set up your own URL's.

Have Fun!

Yes.  I have used one with WinAPRS, as well as HomeSeer.  They work just
fine.

>I've never actually used one but I have to assume whatever driver software
>they have mimics a standard serial port.

Correct.

The only thing they don't seem to work with are products or projects that
require power from the serial port.  I have a few data slicers (ham-comm
interfaces) that refuse to work with a USB to Serial Adapter, but TNC's,
GPS's, Modems, X-10 interfaces, and my Uniden BC-895XLT all seem to work
just fine with one.

So does this mean that the foxhunters out there that do use the Doppler
don't transmit their position? Or is it just the foxhunting part of the
group just uses the aprs side of things for a relative position to each
other? I am trying to understand the basic concept here as the information
and site that I have seen give the general impression that the Doppler is
seeking DF and the aprs data is till going out over the network transmitted
via the radio. Correct me if I am wrong here but I thought that aprs would
allow you to hook the whole thing together to be able to transmit your
position AND DF at the same time. It should be possible to do both is it
not?

If it is a competive hunt: NO.  Why would one person want to help out
competitors??

If it is a search-and-rescue scenario, possibly yes.  But not on the freq you
are tracking the distress signal on!
```

> Correct me if I am wrong here but I thought that aprs would
> allow you to hook the whole thing together to be able to transmit your
> position AND DF at the same time. It should be possible to do both is it
> not?

APRS can not eliminate the fact that you are trying to do several things on several frequencies at the same time.

You need two completely separate radios. One is receive-only for tracking the fox. The other will be receive/transmit ON ANOTHER FREQUENCY (ideally on a different band to minimize interference with the tracker) if you wish to discuss the tracking with other stations, or send position data.

APRS data (i.e. position of the hunter) is normally transmitted on a non-voice channel, typically 144.39. If you want to transmit heading data from the doppler DF antenna as well, you will need more hardware and software (unless you intend to enter DF headings by hand as a comment field in an APRS position report) to format the DF data into an APRS-compatible data packet.

If you want a voice "intercom" to talk with the other hunters and command post at the same time you track the fox and transmit APRS data,   you could wind up with THREE radios (or a dual-bander plus a 2nd single-bander):
  1) Receive-only (possibly a scanner or wide-range receiver) connected to the specialized (RECEIVE ONLY!) doppler DF antennna.
  2) APRS DATA transmit/receive
  3) Voice transmit/receive

The Kenwood D700 would handle 2 and 3 together very nicely since it already has built-in APRS capability. The built-in antenna combiner allows both bands of this radio to share a single dual-band VHF-UHF antenna with no additional hardware needed.

It would NOT be suitable for #1 combined with one of the others since both radios in the D700 share a single antenna jack -- the minute you key up on the non-doppler channel, you would fry the doppler antenna.

33. [aprssig] antenna question

From: "Wes Johnston" <wes@johnston.net>
Date: Sun, 3 Nov 2002 09:33:43 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-105424-2002.11.03-09.17.33--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have a diamond F23 (7.8 dB gain) base antenna and a SG7900 (5dB @ 2m) mobile antenna. The F23 came from the factory a little detuned. I called Diamond and they told me how to tune by spreading out the bottom coil. All was well and it was working fine but had an SWR of 1.2 as a minimum.

I've just moved to a new house and after 3 weeks, got the tower up. I put the F23 on top and couldn't hear a thing. I run open squelch, and could hear packets, but not good enough to decode them. I placed the SG7900 atop the tower (it has a slightly better match at 1.1SWR), and those weak signals went to 5 and 7 s-units (two digi's several 10's of miles from me).

How can it be that an antenna with a good match (1.2:1) can't hear a thing?

I swapped the coax between 100ft of 9913 and 80ft of 213, and it made a
"little" difference in the SWR, but little or no difference in the signal
strengths.

Ideas? Send the f23 to diamond??

Wes

>
>How can it be that an antenna with a good match (1.2:1) can't hear a thing?

I don't know, but I've seen it happen.
I had an MFJ antenna for a while, worked great till one afternoon when I could no longer hit the local repeater with 25W from a place where I usually can hit the repeater with 20mW on my HT.

I went immediately to a friend's place, and put his Bird in the line.
No reflected power that we could measure, but it wasn't radiating either.
We even put the bird in right at the base of the antenna.

25W forward, needle not moving on reflected, and no radiation.

I run the Diamond SG-7900 now.

Try tuning your antenna using a field strength meter! As I remember, tuning
with SWR meter can trick you, depending on the phase of the standing waves.
I once had an antenna that did this, and I finally just had to get a new
antenna.

I suppose that could happen, but what we're talking about here is an antenna that was in service, and tuned properly, turning itself into a dummy load for no apparent reason.

>I once had an antenna that did this, and I finally just had to get a new

>antenna.

That's what I did.

I's put the antenna at ground level and check the SWR at the base of the antenna. A large run of coax can easily mask any problems. But even that might not give you much insight.

I had this once happening to me with a cheap mobil antenna from a company in SC. After about a year it gave up. SWR was just fine, 1.5 or so, but it didn't rx or tx. A field strength meter as someone already suggested can be you best friend in situations like this. It turned out that the antenna was barely radiating. So something inside the antenna was dissipating power. I took it apart and found that a lot of moisture had collected in the base of the antenna. I dried it real good with a hair dryer before sealing it and it was working like a champ again.

If the warranty on your antenna has expired, I'd take it apart and see what's going on. Spider webs are good at collecting moisture and turning antennas into excellent dummy loads.

> How can it be that an antenna with a good match (1.2:1) can't hear a
> thing?

My dummy load doesn't hear much either. :)

Hi all,

We had a problem like this with a 6 meter antenna at a repeater site that blew down. It had low VSWR when reinstalled but couldn't be heard. On disassembly, we got a pint of water out of it; a liquid dummy load. Works fine now.

I could buy that in a fiberglass encased antenna, but I've seen a Ringo Ranger do the same thing - LOW VSWR and totally deaf.   What's sad is no one would listen to me, even after I showed them that placing a smaller antenna on the same coax increased range.   In fact, club members insisted the Ringo be used on a club repeater and then wondered why they couldn't hit the repeater 4 miles away and line of sight...

I would not use a fiberglass antenna for repeater/node service
that was on a tower.

We've always gotten good results with DB Products antennae.

Cushcraft managed, in one design, to maximize the problems associated with dissimilar metals in radiating structures. I've marvelled for years that not only could they screw up their matierials selection, but continue to sell it over the years. There is no real way I'm familiar with to seal a Ringo (Ranger) to prevent the problems associated with dissimilar metals, electrolysis and corrosion.

One group I'm active with has, for as long as I can remember, referred to these antennas as "Ringo Resistors," and refused to employ them anywhere.

You *can* seal dB Products antennas... and they're pretty careful about
selection of metals.  Ringo's, on the other hand, are a different matter.

I've used a fair number of commercial fiberglas antennas on towers with
no problems.  Depending on the prevailing environment, you go with
fiberglas or bare metal, whichever is a better choice.

Why?  I've used just about every type and I've used and have surely seen a
ton of Super Station Masters in service working just fine!
If you want a "quite" antenna, I'd probably go with a folded dipole
arrangement.

A 50 ohm resistor will have a SWR of 1:1 but won't transmit or recieve worth
a damn. (in other words .. SWR isn't everything)

 SWR isn't everything)

The point was, that when an antenna fails, you normally expect a high SWR, because you have a system
that was tuned and working, and is now not working.

It wouldn't surprise me to find out that many antennas aren't presenting 50 ohm impedance when they are
resonant.

I'm still working on getting all the settings right, so heres another
question

Why couldmt I (what problems would it cause If I) set up my tracker as a
relay?  I noticed some people let their D700's relay traffic when I've
been in the vehicle with them.

And, while im on the subject, what would be required to make a KPC9612+
(working as a Digi) respond to both Relay and Wide (or Widen-n) from a
tracker?  I thought I had it set up, but have been informed that it
appears not to be quite right... Since I havent had my tracker up and
running lately, I didn't notice it... Been too busy workig on the
console in my truck.

Thanks

And, you can have antenny's with very high SWR, by design, that work
excellent!

Er... 50+j0... however, any number of things can conspire to change the
complex impedence and produce a result much different from a tuned
radiator.

While I should have thought of it, the point made about water
contamination is a good one.  Further, contaminated coax and heliax will
produce some stellar SWR readings, and poor results if you don't
maintain a high index of suspicion.

Points to ponder.

Indeed, and that was learned the hard way in cellular.
The early morning condensation that seeps into feedline/antenna jumper
cables (the ones with the pinkish semi-transparent outer jacket) is a dead
short at 800 mhz. As soon as the sun came up, the cables warmed up and
outgassed, and went back good.
That was a troubleshooting nightmare.

AT rated impedance...measure one with a precision ohmeter. They are seldom
precisely 50 ohms.
Heat tends to change their resistance.

And exposed bay dipoles have corrosion problems, especially in the
harnesses...each design has its good points and bad. Ive used both
Stationmasters and Sinclair's version and found them just fine for
repeaters. In fact I've got 2 UHF repeaters running on them for over 15
years now.
I will say if you sidemount a fiberglass on a tower,its not a bad idea to
use a piece of PVC pipe with a "T" to capture the tip and hold it firmly.
It will prevent the antenna from beating itself against the tower in the
wind, and keep the pattern more stable.

```
This is the first in what will be a series of status updates.  The findu
backup server is still in configuration mode at this time but there is a web
page that everyone can access that shows the system is alive and lists the
specs on the box.  Clint, Steve and myself are working on this as time
permits.

        I have copied over the java server but do not have it configured just yet.
Do not be suprised if you see findu popup in the list of connections on the
servers soon.  I have to get the Java Virtual Machine installed, then the
Java APRS server configured.

         I do not have a completion date at this time.  I am afraid that if I say it
will be done by the end of November, that the goal will not happen.   I have
made the mistake of establishing goals and some happened, some did not.

        The current page is pretty basic but give everyone a peak at the box and
something to show it is alive.  The findu2 backup web access is currently at
http://findu2.flyingpig.net.  This url is temporary.

        Everyone has been very patient on this endevor.  Thank you very much for
that.  Feel free to forward this message on to those who conributed but are
not on the mailing lists.

It is being heard by G7NFK and being sent to the APRS IS via MB7USA. The
packet is obviously corrupt for several reasons. Normally, depending on
your server software, this packet would be discarded.

Just because you get a good SWR doesn't mean the antenna is working.
I had a customers commercial site go bad that way and SWR was worthless to analyze it.
It was a two stick UHF repeater setup. Both antennas showed less than 3 watts reflected for full forward power. One way, they could hear the repeater, but the mobiles couldn't hit it. The other way, the mobiles could hit it, but they couldn't hear it in the field.
The antennas were commercial quality phelps-dodge 10db fiberglass sticks, and neither looked bad. The decisive test was performed with an ohm meter.
The good antenna showed continuity (a short) at the connector, while the bad one showed an open.

Apparently, the bad antenna had at least a quarter wave of innards still attached to the connector, and mad a fine dummy load.
The SWR meter (or bird wattmeter for that fact) is only a tool, the readings may or may not tell you what you want/need to know.
I'd take a field strength reading on your antenna and compare it to a known good antenna. Even a received signal strength should be indicative if its as bad as you claim.

At 00:52 11/2/02 -0500, you wrote:

It sounds like the antenna could have an electrical connection that has
became resistive due to oxidation. I always use NoAlox or a similar
oxidation inhibitor to minimize the chance of that. It is even a good idea
to assemble the antenna coating all assembly joints with it.

```
Hi all,
  I am pretty new to APRS and have been doing some experimenting with
 all th various aspects.  Having one problem with Igating. I have been
 trying to setup my APRS+SA to gate the TCP stream to the internet.
 Incoming works fine but I cannot make anything leave. We'd like to get
 this working to gate an occasional balloon flight that occurs near the
 area on non standard frequnecies. I have checked "Gate TCP stream to
internet"
 in the "Internet" section and am using the default aprsserve.txt file
with
 the western server listed in that file.  I am using a "trial" copy of
APRS+SA
 as I have just sent my check in to register it and haven't gotten my
serial
 number yet.  Could that be the reason for it's failure?  If not, am I
missing
 something obvious?  Thanks for any help.
 -James  KI0KN@amsat.org

> it's failure?  If not, am I missing  something obvious?

That is the reason.  An unregistered version makes an "unverified"
connection to the server.  The server sees this and does not allow any
packets not originated by the connected station through.  In other
words, your ID packets:

KI0KN>APS215,TCPIP*:rest of packet

Will be passed to APRS-IS as:

KI0KN>APS215,TCPXX*:rest of packet

However, packets gated by your station from anyone else will be dropped.
Once you get your registration from Brent, you should not have any
problem.

73,
```

66. [aprssig] NOSaprs (APRS Igate) - release 1.15b2 available

From: Maiko Langelaar <maiko@langelaar.net>
Date: Mon, 04 Nov 2002 17:39:46 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-105638-2002.11.04-18.18.23--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Greetings,

I have released another patch for NOSaprs. Most of the changes were made to keep up-to-date with the latest standards that *seem* to be in affect with regard to the APRS Internet System.

What is NOSaprs ? In short, it's an APRS Server/Igate bolt-on to JNOS and TNOS systems, allowing the sysops of those systems to support their local APRS users, using existing infrastructure, without the need to setup separate boxes or radios, etc.

For a complete description of what NOSaprs is, and what it does, as well as update kits and documentation, please visit the official site at the following URL :

   http://www.qsl.net/ve4klm/packet/aprss.html

Best regards,

Maiko Langelaar / VE4KLM

I see Alaska!!! WL7JA-1, KL7Z-1, and APRSDANC are the first stations
I see! All coming from AL7LI-11! I can't wait to see more!

Subject: [aprssig] APRS in Alaska

Why don't I see any APRS stations in Alaska on the IS? Is there APRS
infrastructure up there?

Subject: Still settimg up kpc3

I'm still working on getting all the settings right, so heres another
question

Why couldmt I (what problems would it cause If I) set up my tracker as a
relay?  I noticed some people let their D700's relay traffic when I've
been in the vehicle with them.

And, while im on the subject, what would be required to make a KPC9612+
(working as a Digi) respond to both Relay and Wide (or Widen-n) from a
tracker?  I thought I had it set up, but have been informed that it
appears not to be quite right... Since I havent had my tracker up and
running lately, I didn't notice it... Been too busy workig on the
console in my truck.

Thanks
Ken

More attenuation (ie using lossier coax) will always improve your SWR,
btw.

73. [aprssig] TH-D7A(G) as a digi?

From: "Peter \"Dakota\" Summerhawk" <dakotas@dotorg.org>
Date: Tue, 5 Nov 2002 22:09:50 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-105779-2002.11.05-23.53.25--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Has anyone played around with making a D7 a digi? I am looking at this
option for a relay to another site from one frequency to another in a short
hop. Can the radio be set up as a digi by itself? I do have a handspring
with pocket APRS and a cable for the TNC but would prefer to have the HT in
standalone mode if possible. Or can someone point me in the right direction?
Thanks
Peter "Dakota" Summerhawk N0WRE

Rendered body type: text/plain

I beleive the manual on the D7 says it will not work as a digi peater.
The TNC may lack the specific digi peater commands. I had to go to a
different radio for my digipeater. I went to a MFJ APRS unit. It is
working great, but this is my first year to try it out.

True. I once has such a bad brand of RG58 cable that it didn't matter if I
put an antenna at the end or not. VSWR was very good; i.e. a cable
dummyload... I suspect the cable was intended for ethernet, not for 2 meter RF.

Kind regards,

Henk.

```

```
Just installed WinAPRS 6.2.1, and have a few questions...

1. Can I check my mailbox through the software, or am I required to go
through the terminal window long hand?

2. Can I do a "keyboard-to-keyboard" QSO in APRS?

3. How do I know/set my "ALIAS"? There was no provision given during setup.

Thanks Much!

73.

I'm a high school physics teacher in Missouri City TX. I just wanted to let
everyone know that we've started a new Amateur Radio club at our school-
the Elkins High School Amateur Radio Club (EHSARC). Our callsign is KD5UGQ
and we'll be active on APRS soon. We recieved a grant from the ARRL and
purchased a D700 for the classroom. Within a week, we plan to have the
antenna up and we'll be on the air. Look for our packets and ask the kids
how they're doing as they pursue their licenses. These are tomorrow's
engineers, scientists, doctors, etc.- they're a great bunch! Many of them
are in a DSP-based engineering class that I teach.

Rendered body type: text/plain

Finally found the info. In the UHF Mocom 70 mike bias is provided by R180, a 560 ohm resistor. Just lift one end of R180 and the impedance raises from about 500 ohms to about 4 k. ohms. You ought to have enough drive then, from either the 9612 or 9612+. R180 is mounted near the transmitter test socket and one end should show continuity to pin 14 (one of the center pins) of the test socket. I assume that the other breeds of the Mocom are similar.

We've used this method to attach TNC's to several converted commercial rigs and pulling the mike bias resistor usually does the trick. Another way is to use the PL or CG input to the transmitter modulator for the TNC audio, but then you can run into pre-de-emphasis issues. YMMV.

Good luck,
Al, K9SI

81. [aprssig] D7 is not supposed to work as a digi

From: "Darryl Smith" <Darryl@radio-active.net.au>
Date: Thu, 7 Nov 2002 17:03:19 +1100
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-105991-2002.11.07-00.47.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
There is no way that the D7 can do digipeating... It can barely handle
normal packet. Basically it can only have one packet outstanding, not
the 6 or so that normal TNC's can have. And RX is similar.

Do you cannot use a D7 as a DIGI.

BUT... If you program a PIC to do it, you can put the D7 into non-aprs
TNC mode, and get it to do the work. Almost any PIC would work as a
digi, with the real limitation being the fact that you cannot send too
many packets out to the network at a time... You can even monitor this
by looking at the TX light and making sure that one packet is sent
before the next is tried to be sent.

So that would make the D7 a small self-contained low power digi...

>So that would make the D7 a small self-contained low power digi...

except for the fact that the D7 can not (apparently by my experimentation)
transmit KISS packets and therefore can not correctly formulate paths the way
a DIGI must.

```
Well, I have the solution to the D7 issue, use it as a tracker with a GPS
and use another radio and equipment for the digi. Planning on using the
radio shack dual band and a handspring with the shine micro in it running
pocket aprs in digi mode. Anything else is not going to work from the emails
that I have gotten and seen on the list. I thank everyone for the
information.

Hello all,

I know that APRS+ (plus) will work with DeLormes "Street Atlas USA 9", but
will it work with DeLormes "Street Atlas 2003 USA"?

Anybody know?

Thanks a bunch!

73.

Nope. At present APRS+SA will not work with the newer, buggier, slower
Delorme mapping engine.

73, Bob, KD7NM

This depends on the version TH-D7. In Europe there are 2 versions, one which has a menu entry in the APRS menu to select 9600 baud and an older one which does not have this. The older one has the problem you mentioned, the newer one can transmit in KISS as long as you don't throw too many packets at it at once (read: maximum two, better do one to be sure..).

I guess the same difference exists between the TH-D7A and TH-D7A(G); I assume the TH-D7A(G) can do kiss with the same limitation as the TH-D7E(Version 2).

Kind regards,

Henk.

APRSplus ONLY works with the "classic" Street Atlas Vers 4 through 9.

It WILL NOT work with ANY of the products based on the buggy, sluggish, resource-hogging new-style user interface used by Street Atlas Road Warrior, Street Atlas "Deluxe", Street Atlas 2002, TopoUSA or 3-D TopoQuads.

I have SA 2003 and hate it. It is no way an upgrade but rather a replacement. It is based on one of their other products and takes a lot more screen real estate, is slower in operation and presents lousy maps. I complained to DeLorme and they recommended SA 9. I have not tried to make it work with APRS+ but I bet it doesn't.

Get a copy of SA9 and hold it close to your heart.

2003 does have some updated maps that include my fairly long private drive; everything else is a downer as far as my use is concerned. We travel a lot over the USA and have depended on it for since SA4 but will not be buying any future versions.

Joe Dorn, W5VEX, Belton, Texas

> would like it to default to "filtering" out of the box.

Actually, if I had pleny of code space and memory and file space (I didnt in DOS), I might be tempted to keep EVERYTHING but for everything that is not a standard APRS net name, keep that under different ALTNET categories (not normally displayed). Thus, as you say, a DISPLAY filter. But by default, you only display everything that is sent to only the generic APRS type TOCALLs, but then you keep everything else under individual ALTNET categories... if you like.

And then the viewer can decide to go select an ALTNET to view, such as the private GOCART net, or DADSTAXI, etc...

Then my desire for not cluttering the default APRS display is met, yet your users dont miss anything if they want to view it. In fact, they can be alerted to a list of "ALTNETS" that you have detected as currently operating on frequency... and then decide to view if they like...

I have the (G) and it is the one that I have found to not allow me to transmit kiss. You and I have had exchanges about this. I've sent you example byte streams, which you have said were correct etc. So, I don't know what else to say. Sure, the transmitter keys, and data goes out. But narry a TNC that I have tried can decode the data. I did not dive any deeper. My local digi would not digi the output packet, and others TNCs would never decode the packet, but would display data I transmitted in non-kiss mode.

Yes, this is exactly what ALTNETS were designed for...

It might be better to say that "properly coded" APRS stations would not
see this data, but not all APRS client software did it the way we
intended it...  So I am glad we are re-visiting this issue and having this
healthy discussion..

Bob

```
I have 450 emails to plow through, but I just got back from travel and
notice that PCsat is in positive power budget and not resetting in
eclipse!  This will last for a good two weeks, so PCsat is FULLY
operational.  More later as I dig out from under all this backlog and get
caught up

Feel free to use it normally, and remember if you can think of a way to
use the 144.39 downlink over north america, let us know...

This solution I like!  It solves your testing problem while letting
users display whatever they wish.  It even detects what's out there
if they're really interested in seeing it all.

I'll try to switch to this method of operation sometime soon.

Remember, now with APRStt, you can use anyone with any HT (with a Touch
tone key pad) to enter data into APRS, or let APRStt speak to those users
data from APRS...

For example, you could send an object for anything important happening
anywhere at the event from an APRS station, and that packet would be VOICE
ANNOUNCED by APRStt on the APRStt frequency for those people monitorig
with an HT.

Or observers around the course could enter data, say runners numbers or
scores or antyhing else by TOUCH TONE and APRStt would convert them to
APRS positions for display on any APRS maps or messages for logging
electronically to files...

Unlimted potential... but needs planning and thought before hand as to
what particular data would be good for your particular event...  but
EVERYONE with an HT  can play, no longer just those with D7's...

```
Another way that only requires 3 components:  Connect the collector of a
2N2222 type transistor to the mic input.  Connect the emitter to ground.  A
100k resistor goes from the collector to the base, and a 0.1 uF capacitor
goes from the base to your audio input.  If you were to cut open one of
Motorola's transistorized carbon mic replacements, this is what you'd find
connected to a dynamic mic element.

Load up one of the PM's for satellite work.
In fact, hook its serial port up to an old DOS PC or Laptop running APRStk
and the radio will auto tune to every amateur satellite that comes into
view.  You will capture packet from the ISS and PCsat and UO22.  You will
hear astronauts any time they work voice.  You will hear UO14 and AO-27 or
SO-41 any time they are doing voice...

All of this hooked up to a 19" whip antenna on the roof over a chicken
wire ground plane.  No rotators, nohing (but keep the coax run short)...

If you like that, then if you want to add a TV rotator (any brand that
runs on 24 VAC) then you can also hook it up and use a small beam and then
you will heave everything down to the horizon...

see http://www.ew.usna.edu/~bruninga/astars.html

A fully automatied satellite station with nothing else to buy...

Bob

99. [aprssig] Perl wx-aprs script.

From: Ed van Mol <ej.vanmol@quicknet.nl>
Date: Fri, 08 Nov 2002 11:26:17 +0100
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106151-2002.11.08-05.12.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'v update Perl 5.6 to 5.8 and now my script isn't working very well..
I'll get this error;

```
Linux:/home/wx # perl wx-aprs.pl
Bad arg length for Socket::pack_sockaddr_in, length is 0, should be 4 at
/usr/lib/perl5/5.8.0/i586-linux-thread-multi/Socket.pm line 373.
```

I've look at this code but it doesn't make any sice for me..
The part of the script:

```
##############
use Socket;
$aprsServer = "localhost";
$port = 1315;
($d1, $d2, $d3, $d4, $rawserver) = gethostbyname($aprsServer);
$serveraddr = pack("Sna4x8",2,$port,$rawserver);
$prototype = getprotobyname('udp');

socket(SOCKET,2,SOCK_DGRAM,$prototype) || die("No Socket\n");

$opaddr   = sockaddr_in($port_out,$iaddr);

print $opaddr."\n";

        ($sec,$min,$hour,$mday,$mon,$year,$wday,$yday,$isdst) = gmtime;

        socket(OUTSOCK, PF_INET, SOCK_DGRAM, $proto_out) or die "socket: $!";
        connect(OUTSOCK, $opaddr) or die "connect: $!";
        printf OUTSOCK
```

Any help would be appriciated, so i can use my WX-aprs station again...

73,
Ed.

I don't think that the firmware versions between the EU and US radios
are necessarily in synch, especially since KISS is not officially
promoted for the D7. Although, I seem to remember an ad on the corporate
site about this (not the .net site). Doesn't the EU version also support
Smack, which the US version does not support?

> Sure, the transmitter keys, and data goes out. But narry a TNC that I

When I attempted to add support for the Kenwoods in the Cybiko software,
beta testers reported exactly the same thing as you, Gregg. That's when
I decided not to waste my time with the Kenwoods anymore.

I was thinking of purchasing one, but this really turned me off. Why
would I want to buy a radio that I can not utilize the way I intend to?
Not trying to bash Kenwood here, as I do think they make good products,
just expressing my disappointment.

Perhaps someone understood KISS to mean Keep It Simply Stupid.

101. [aprssig] 802.11x - operation and location

From: "Sadowski, Allan" <allan.sadowski@ncshp.org>
Date: Fri, 8 Nov 2002 08:40:01 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106170-2002.11.08-08.23.42--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have a question for the engineers/technical folks out there who understand DSSS better than I do... and it does relate to positioning.... think APRS /AVL / Telematics..... on a micro scale... inside a school/office building/warehouse/hospital.... as well as having another use....

I've seen many articles on war-driving and war-flying.... and the ability to "DETECT" 802.11 devices... my question is... what are the velocity limits for actually "USING" 802.11 on the move (extended connect times and file upload/download) .... and what is the real availability of Mobile IP (handoff from AP to AP) as an open - usable standard.... seems that any detections while in motion... must be occuring where the relative velocity must be close to zero... in relation to the war-driver and the AP or other device being detected...

I'm familiar with using 802.11 sitting in a classroom... then moving to an office... then going over to the coffee shop.... and similarly... using it in a hotel, conference room, and office... BUT... what about using it moving down the highway!!!

Given it's relatively limited geographical coverage capability (lets talk omni antennas and what's out there in use right now)... it would seem that you wouldn't be in one AP's area of coverage long enough to do much before a hand-off would have to occur to another AP... given the state of Mobile IP that I've been able to find out about in this scenario... I can't believe it's widely being used... and I'm still not comfortable with doppler smearing and multipath fading issues... not killing the usability of the system... on the other hand... there are DSSS devices out there that are on mobile platforms... but I'm not sure their chip rates are on the order of the bandwidth of 802.11x devices

Any technical folks here that have actual field use examples of extended use going 10km down the road at 100km/hr ???

I've been asked about implementing 802.11x networks by three different agencies... and I'm aghast at the lack of data ... personally... I've no problem connecting to an AP outside the office... from a parked car... but going down the expressway... seems that between the multipath, coverage gaps, Mobile IP, and doppler smearing.... no way....

Similarly... I'm looking for non-proprietary ways to find the location of an 802.11 device.... to an accuracy of 10m... inside buildings (so no GPS)... given 99.9% of 802.11x devices are DSSS.... it would seem that the PN sequence could be used like inverse GPS... anyone know of any implementations that actually do that (with the time delay being determined at AP's)...

I'd love to use the above in a search&rescue scenario... (PDA with 802.11 on every rescue worker)... similarly... track high value items in a large building... heck... track key personnel going around building... or monitor security personnel as they travel doing rounds... lots of uses... and though there are solutions that work... that require EXTENSIVE building wiring... I would think 802.11 would be a lower cost approach...

THINK APRS / AVL on a micro scale....

TNX in advance...

Rendered body type: text/plain

I have just played with the serial port version of this GPS and it is a tad more "deaf" than my Garmin GPS's... but not too bad...

An example output stream follows...

```
$GPRMC,145717,A,3544.1327,N,07837.7888,W,000.8,326.7,081102,,*09
$GPZDA,145717,08,11,2002,,*41
$GPGSV,3,1,10,02,13,202,00,05,02,037,00,06,09,098,47,11,07,268,00*7F
$GPGSV,3,2,10,14,51,086,48,20,22,316,00,21,48,179,00,22,20,199,00*7F
$GPGSV,3,3,10,25,69,306,50,30,33,052,46,,,,,,,,*76
$GPVTG,317.1,T,,M,000.6,N,001.2,K*61
$GPGGA,145718,3544.1329,N,07837.7887,W,1,04,02.8,0086,M,,M,000,0000*6A
$GPGLL,3544.1329,N,07837.7887,W,145718,A*32
$GPRMC,145718,A,3544.1329,N,07837.7887,W,000.6,317.1,081102,,*0D
$GPZDA,145718,08,11,2002,,*4E
$GPGSA,A,3,30,25,14,06,,,,,,,,,04.4,02.9,03.2*0F
```

The case is about 9-10 cm in diameter...   and comes with cable and windshield mount....

The serial line uses pins 2,3,and 5 on the DB9.... but also as pins 7&8 shorted together...

It uses a six pin RJ type crimp connector... so if you use CAT5 cable... it only uses three of the six wires on the RJ connector... it gives you plenty of remaining wires for power and ground.... I'm looking into using the power available on a keyboard jack from a notebook...

Not bad for the price...

Does it start automatically on power up or do you have to play some tricks
with it to get it operating?

Also, what is the aquisition time and how much power does it draw?

A local ISP here in Sioux Falls, called Prairie Fire is doing "last mile" ISP service via 802.11b. Their access point(s) used to beacon AP ID's and I could at least pick those up while driving at 35 to 40 MPH. Funny, but when I first noticed their beacons and tracked them down and called to ask about their service they were quite surprised to find I knew about them as they were still "in testing stage." When I pointed out their AP's were broadcasting the ESSID, "Prairie Fire" and that I could recieve their signal all around town I got silence from the callee. Shortly after that, they set their AP's not to beacon an ID.

I also found out they offer no mobile service. They come out and bolt a small box to the side of your house and put a small antenna on the roof. I believe they have some proprietary firmware/hardware and software that prevents an end user from just slapping in an 802.11b card into their laptop and going to the local park to surf. They also limit you to one computer per interface/account.

I was inquiring for a client who was currently using Sioux Valley Wireless for Wireless Cable TV and wireless broadband but was having difficulty with his fixed-point connection. Suprisingly enough, his office was in one of the tallest (occupied) buildings in South Dakota, the 9 story US Bank Building in Sioux Falls. And his office was on one of the top floors and line of sight to SVW's tower. Our speculation was that despite having a large (about 20 inches square) flat-panel antenna in a utility room window, the aluminized coating of the windows was killing his signal. When we moved his office to Harrisburg, SD this spring the SVW guys came out to do a site survey and based on the fact that "we" had numerous QOS complaints from the old location, they were reluctant to install the service, based on signal strenth levels at the new location (tree windbreak several hundred feet away knocking down signal). In their defense, the tech did strap on some spurs and climbed a nearby light pole to see if the signal was better up a little higher. It was not. Fortunately, I was able to talk my client into dropping a 50' hunk of Rohn 18G into the ground, which was practically given to us by a local tower company... He now has wireless broadband internet access, again.

>I've been asked about implementing 802.11x networks by three different
>agencies... and I'm aghast at the lack of data ... personally... I've no
>problem connecting to an AP outside the office... from a parked car... but
>going down the expressway... seems that between the multipath, coverage
>gaps, Mobile IP, and doppler smearing.... no way....

The problem is, like any other digital data service above 800 MHz, it requires a large amount of local infrastructure to provide reliable service due to the issues you point out. If you look at PCS phones, they require about 4x the amount of antenna points in an urban setting when opposed to 800 MHz analog cell-phone service. 802.11x was never intended for anything but local area networking. Local being a few hundred feet to a few thousand feet.

Even the big boys like Sprint, Verizon, and ATT are having problems with mobile internet access. I sat down the other day with a local Verizon Rep and found out how poor their mobile digital service really is. MMS only sends 160 characters Max. 1XRTT and Brew are available only in very small service areas and not at all in South Dakota or Montana. Odd but they are selling their $90 express connect kit here (for PC/PDA), even though you can't use it. (!) BTW, avoid Verizon's Flagship Z-800 phone - it doesn't do 1XRTT. "Can you hear me yet?"

Another thing I found out is that ATT is abandoning/shutting-down CDPD by mid-2004...and they don't have nearly enough new infrastructure in place to replace it.   They must have awfully big plans for expansion in the next 18 months...

>Similarly... I'm looking for non-proprietary ways to find the location of an
>802.11 device.... to an accuracy of 10m... inside buildings (so no GPS)...
>given 99.9% of 802.11x devices are DSSS.... it would seem that the PN
>sequence could be used like inverse GPS... anyone know of any
>implementatio
>ns that actually do that (with the time delay being determined
>at AP's)...

It's being done. I'm pretty sure I've shared these links with the SIG before. You might want to look through the listings on some of the web sites devoted to public access 802.11x like nocatnet, netstumbler, personaltelco...   I'll see if I can dig some stuff up.

>I'd love to use the above in a search&rescue scenario... (PDA with 802.11 on
>every rescue worker)...

During the ground zero clean-up I noticed (on TV) that several of the rescue workers were using what appeared to by "Symbol" handheld data terminals with built-in GPS and 802.11b.   They mapped the entire area to a few centimers' accuracy using LIDAR. The also turned on the defunct Riccochet network locally.

I bought one, too.

The first one that I got, took 20 minutes from a cold start to acquire an accurate fix. I took it back and got one that acquired and locked in 5 minutes.

fyi.

This is from quite a while ago. Not sure whether either method
still works:

Date: Fri, 17 Dec 1999 10:15:48 -0700
From: Thomas M. Schaefer <toms@inconnect.com>
To: TAPR APRS Special Interest Group <aprssig@lists.tapr.org>
Subject: [aprssig] Email mechanism and a comment

For what it is worth to add to this discussion, you can send email
from APRS to the Internet in at least two ways:

Send an email message to <callsign>-IM and the message will go to
email. This one works if the recipient is a ham and has their email
address listed in QRZ database OR an arrl.net (or rac.ca for VEs)
email forwarder.

Send an email message to EMAIL with the content being <email
address> <space> <text>. This one works for non-ham callsigns.

My two sense on the sending email the other way is that the
technical issues are handled, but its those darn rules that are the
problem. I do wonder if we are applying a higher standard to email
than we do to the APRS programs in general. If I ensure that the
message is originating from a ham (spoofing could happen on the APRS

registration as well), then I would think that was acceptable. The issue comes down to the level of verification that is built in the system. I ask the question that when someone registers an APRS program and they supply a callsign, how much checking is done to make sure the person requesting it is really a ham? If I wanted to register DOSAPRS. does Bob only snail mail the information back to the callbook address, not the one on the registration form (or the email address) ? Any other authors do this kind of checking? Because if this level of checking is not done, they each IGate operator is taking a risk because a non-ham could have easily received a validation code to their APRS program and may be sending illegal packets through APRServe right now.

Very simple, but note that this is a SMS (short message service; i.e. single line) type format similar to a two-way pager or messaging cell phone.

Send a regular APRS message to the destination EMAIL. The first unbroken string in the message body must be an Internet email address followed by a space. The remainder of the single line message is the text -- it helps to have a really short email address.

[Of course you must be within range of an Igate for it to work...]

I received a Priority Mail package from Ohio with three 27C256 eproms in it today (Friday 8 Nov). I assume these are to programmed with UI-DIGI firmware; however:

1) There was no information whatsoever enclosed.
2) I have not received any email or other communications about this
3) I have not received any source code to put in the ROMs.

If you are the sender, please contact me.

I suppose that I should have been more specific about what I observed.

The first RS GPS I got took 20 minutes to lock...every time I powered it off and back on. It would go into 2D mode when under heavy foliage and full loss of lock whenever I was under a gas station roof.

The second GPS found a 3D lock in under 10 minutes from a cold start and under 5 minutes after that. The same foliage that would cause the first GPS to go into 2D mode had no impact on the second one. It would still loose signals under metal car ports at gas stations, though.

Just fyi.

Which is consistent with an uninitialized receiver, a blank almanac and a full-sky search. 20 min is on the outer limits of acceptable for a real cold-start.

5 min suggests that the receiver had been initialized once before (at least) and that it had an almanac stored in memory, AND that it was more or less in the same region in which it was powered down.

If the receiver took 20 min EACH time it powers up, that's moren'n likely a memory problem: not storing the almanac appropriately.

Most likely diagnosis with these details is a bad antenna or feedline
(if appropriate).

Allan,
Have you figured out what it takes to "wake up" the GPS yet? I haven't hooked
up the laptop to another computer to see what the initialization string is.
Have you?

I'm cautiously optimistic about this thing.

Ev, W2EV

Some more info on 802.11x client location finding.

Skimpy on details, but an actual deployed system:

http://www.salon.com/tech/feature/2002/06/11/stalker_tech/index.html?x

A commercial system:

http://www.ekahau.com/

Note: what follows is long and rambling... If you don't care about
802.11x or have ADHD stop reading now...

This week I also set up a Sony Vaio R505 running XP Pro with integrated
802.11b. The onboard mini-pci card has a slide on/off switch on the
keyboard portion of the lap-top, which is a nice feature, especially when
flying in commercial aircraft. The OEM for the WiFi solution is Ambit.

http://www.ambitmicro.com/micro/MiniPCI%20Wireless%20LAN%20Card.htm

My first impression of this wireless solution was disappointment. When I
flipped the switch of the WiFi solution on (after disabling the nearest
Access Point's security features), the OS popped up the little box saying a
wireless network had been found. Great. I was able to bring up a web
browser and surf around. Then I looked at the connection properties in
XP's wireless utility. It said connection signal strength was poor and I
was only connecting at 1 MBPS, this and I was only 20 feet away from the
access point antenna. The whole point of going with onboard WiFi was that
they usually have better reception qualities due to the fact that an OEM

can place bigger (diversity) antennas in the screen part of a laptop... I was not amused. Several software installs and reboots later the observed signal strength and throughput did not improve.

Then I went and tried to setup actual network connectivity through the wireless network. It was a no-go. I had the workgroup name right, I had all the passwords right, but I could not find anyplace to enter an ESSID outside of the XP Pro wireless connection screen. Some cards, like the Cisco 350's, the ESSID can be set in the Device Manager. I looked under the Ambit's properties - no where could I find a place to enter an AP ESSID. Then I started looking through the installed software on the Laptop and the Systray. Nothing. Now I'm getting mad. I look in the Add/Remove programs window and find an Ambit utility pack - says it's installed. Back to the program list - nothing.

I guess it's time to go to the Internet. Ambit has no drivers/utilities on their web site. Sony Support has a Ambit driver, even though it's the same version installed on the laptop I download it anyway. I go to install it and get the install/uninstall/repair box. I choose repair. The install routine notes that the Ambit Client Utility is not installed (DUH!), but that all the drivers are. So I install the Client Utility. Up pops a new icon in the Systray. I click on it and find that the client utility is pretty nice. It even has a software button to turn the card off and on. I'm still not happy with the reception though. Then I see it...the card is tuned to channel 4. Channel 4? Funny, I don't recall using channel 4 on any Access Points... Doooh! Windows XP locked the 802.11b card on the wrong channel. Close enough to get some packets through though. I set the ESSID in the utility to match the AP and reboot. (Windows XP doesn't note 802.11x channel, BTW)

Once I launch back into Windows the signal strength is noted in the Client Utility as excellent and the throughput is listed at 11 MBPS (the card is on channel 1). Ahhh...my blood pressure goes down. And I can connect to the office network. My blood pressure goes down even more. I guess I'm not gonna have to stomp on a new laptop and send it back to Sony...

I hope this was just a glitch on this particular unit. If Sony is shipping their laptops with the Ambit Client Utility not installed, it's going to lead to a lot of tech support calls and more than a few units sent in for service or permanently returned. Most people wouldn't have a clue as to what was going on here.

73,

Mark

118. [aprssig] Experimental WIDEn-N digi code for JNOS ...

From: Maiko Langelaar <maiko@langelaar.net>
Date: Fri, 08 Nov 2002 20:35:45 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106244-2002.11.08-21.14.09--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Greetings,

If anyone is interested, I'm putting together some code that will allow JNOS to catch WIDEn-N digi calls and respond accordingly just like a standard APRS digipeater. This is still very experimental, but I believe I have it working.

I did this because someone asked me to do consider it. If anyone else is interested in this, and would like to test it for me or just try it out in general, then please let me know, and we can take it from there.

Best regards,

Maiko Langelaar / VE4KLM

```
I tried the PDA version out yesterday and it took about 2 minutes to get a
2D position after I told it I was in KY.  I'd like to try it out with my
TinyTrakII but I've just got the PDA cables.  Does anyone have the pinout
for the Modular connector?

Jerry

Which is consistent with an uninitialized receiver, a blank almanac and
a full-sky search.  20 min is on the outer limits of acceptable for a
real cold-start.

5 min suggests that the receiver had been initialized once before (at
least) and that it had an almanac stored in memory, AND that it was more
or less in the same region in which it was powered down.

If the receiver took 20 min EACH time it powers up, that's moren'n
likely a memory problem: not storing the almanac appropriately.

120. [aprssig] ID versus NOID digis

From: Bob Bruninga <bruninga@usna.edu>
Date: Sat, 9 Nov 2002 10:07:43 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS Special Interest Group <aprssig@lists.tapr.org>
Message-ID: <LYR842-106302-2002.11.09-09.51.24--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
> I'm putting together some code that will allow JNOS to [do] WIDEn-N...

Please set it up with NOID.  I just visited Colorado and Atlanta and their
digis appear to be ID (but aren't labeled as such)..  Thus every packet
```

from all over 3 states and 50+ digipeaters all arrive EXACTLY THE SAME as W0XXX,WIDEn-N, in COlorado and N4XXX,WIDEn-N in Georgia.

Totally useless information!

There is no way to know where the packet entered the network or what the ORIGINATOR intended. Of course it showed my nearest digi is W0XXX or N4XXX, but duh... I konw that by looking at my map or my path list or watching MY OWN digipeated packets (launched with WIDE,WIDEn-n). I dont need every packet for 3 days telling me the same information! (at the expsnse of throwing away the originators digi).

For an area that prides itself on SAR and especially an area where there are more digipeaters than there are users, I am still totally amazed at how self defeating and restrictive these networks are.

WIDEn-N digipeaters should be set with the UIFLOOD NOID (the default) so that digipeaters do not obliterate originating path information. If sysops who don't do it this way (the way APRS was designed) and are so proud of their obstinance, then they should at least change the DIGI OVERLAY charactere to "I" instead of "N" so that their poor users will know what they are missing.

Packets in a proper NOID network, will arrive as XXXXX,WIDEn-N where XXXXX shows where the packet FIRST entered the system. This is vaulable information for many reasons.

Packets in a network with ID set will arrive as XXXXX,WIDEn-N where XXXXX shows the end user the callsign of the digi he is nearest to. WHICH he ALREADY KNOWS! duh... (and oblterate the originators digi).

The problem is that unless the "ID" DIGI's are indetified with the "I" overlay, then the poor users have NO CLUE which is which and the network path information is USELESS! "ID's" only value is in observing XMTR coverage areas for the DIGI owner. But this can be done AT ANY TIME by the digi owner by simply sending out a packet with the path of WIDE. Then his digi will identify itself. There is NO reason to FORCE this ID on every single packet at the expsnse of obliterating all origination and prior path data the other 99.999% of the time.

Having ID set has no operational value to APRS networks. (though it does help the SYSOP during initial coveage evaluation of the DIGI's TRANSMITTER (note, it has NO value in assessing the digi's ability to HEAR USERS which of couse is its purpose in being!)...

Having NOID set (the default in the Kantronics TNC) and the way the APRS widen-N network was designed has many benefits:

1) It allows all packets to arrive with the SOURCE digi information intact. This allows EVERY packet to be traced to the area of the originator

2) It allows tracking TNC's without GPS all over the country WITH NO GPS. Thus a TINY-TRACK, or MIM or any TNC can run for a year on AA cells and still be tracked anywhere in the APRS world.

3) It allows search and rescue to immediately know the area of the source of any single packet such as a message packet, an ID packet, a NON APRS packet, a status, a WX report, a WRONG position report (such as an HT without an active GPS plugged in), etc.

4) It allows for reverse path determination for messaging. As soon as you see a SINGLE packet from someone, simply look at your map and determine the REVERSE path to get your packets back to HIS digi and bingo, good DIRECTED QSO's...

To determine if digis in your area have ID set, use the path of "WIDE1-1". If the packet comes back as XXXXXX,WIDE1 then it has ID set. If that XXXXX digi does not show on your map with an "I" overlay character, then encourage the SYSOP to either change to a UIFLOOD NOID setting or to change the overlay character to "I".

If it comes back as just "WIDE1" then it is a proper WIDEn-N digi with NOID set as intended. Notice that this has TWO advantages:

1) It saves 7 bytes on EVERY packet transmitted (if launched as WIDEn-N)

2) It arrives as YYYYY,WIDENn-N everywhere if it is launched as WIDE,WIDEn-N, thus preserving the SOURCE digi "YYYYY" where the packet

entered the network.

AND the ORIGINATOR OF THE PACKET HAS THE CHOICE!

CONVERSLY, The SYSOPS of the "ID" digis are forcing their own callsigns on every single packet and destroying the PATH data of the orignators and users who are given no choice.

APRS is supposed to be a flexible network and to fully allow PATH data of the USERS to arrive at the end point. The use of ID by some SYSOPS destroys this network concept and prevents APRS from fulfilling its design potential.

In using Belkin's USB > Serial adapter, I've found them disappearing under Windows 98 SE. My desire to use this device is so I can connect a WX station to a laptop. If the OS suddenly decides that that port isn't there, I'm afraid I'll be TXing old or corrupted data onto 144.39.

Of course, if I were to swap out the KPC-3 8.2 (non-plus) with the KPC-3+ 8.3, I could use that TNC's second "pseudo"-port for WX data. 73

Bob made some very powerful observations on his recent trips. I would like to point out, thought... NOID has a very severe problem associated with it, too.

Interestingly, it is the _same_ problem that ID has... loss of the same useful information, believe it or not.

In my area, there are stations that launch packets like this:

VE3xxx>APRS,WIDE3-3:...

With NOID set on the digi's, this is what we all see:

VE3xxx>APRS,WIDE3-3:...
VE3xxx>APRS,WIDE3-2:...
VE3xxx>APRS,WIDE3-1:...
VE3xxx>APRS,WIDE3:...

No idea where to begin looking for VE3xxx, should the TX frame not include location information.

Just an observation...

Yes, this originator has chosen to save 7 bytes on every packet to improve his reliability, but at the expense of showing his originating digi.

This same user can choose to use an outgoing path of WIDE,WIDEn-N and then his packets will arrive with his source digi intact.

Thus the value of NOID is that the packet arrives in a format which is the "choice" of the sender, not something that is unilaterally forced on 100% of every packet by the DIGI.

Yes, good point. In areas that have been "ID" in the past, if the digi owners upgrade to NOID, then the users will have to then decide if they want to save the 7 bytes on everypacket (with no source digi info) or use the path of WIDE,WIDEn-N to assure the originating packet arrives intact.

Only the users know their immediate needs and their intent should be respected by the digi.

Hi Bob,

Sorry for repost, my original was badly formatted, and I had the wrong From email setup so it bounced from the list.

> Please set it up with NOID.

Most of the NOS types that I know run their TNC with a KISS eprom, so parameters like NOID and others simply are not an issue in those cases.

> Totally useless information!

What would be most usefull to me is a VERY GOOD description of how I should handle a WIDEn-N scenario, complete with examples. I see stuff all over the internet of how it *should* be done, but frankly I have yet to find anything very comprehensive, detailed, or consistant for that matter. If this has already been posted to this list a long time ago, then please forgive me for asking you to do it again.

My latest implementation is based on some notes that I read from an INI file off a DIGI_NED system. I picked DIGI_NED since I have heard many good things about it. Maybe Henk has something more detailed. I would be most interested in knowing how to *PROPERLY* implement this.

> APRS is supposed to be a flexible network and to fully allow PATH data of
> the USERS to arrive at the end point. The use of ID by some SYSOPS ...

I fully understand your concerns. I don't think it will be a big problem within the NOSaprs community (as small as it is anyways :-) I'll make sure to distribute the issues regarding NOID when the *official* release is put out to the masses.

Best regards,

Maiko Langelaar / VE4KLM

If the originating digi uses a specific callsign as its first hop, rather than a generic WIDE, this would give a good indication of where to look for return paths. There are times when using TRACE or TRACEn-n will give more specific results on such return paths, but it also eats up some significant amounts of bandwidth. I wouldn't use such a path on a regular basis from a fixed location, but using it judiciously can result in a more efficient path from one specific location to another. Just remember to reset your path back to WIDEn-n when you have the results you're looking for! 73

One example for another potential 'quest' in the APRS microcosm.

Many didi sysops set the MYREMOTE and RTEXT string in a KPC3+ so as to allow remote administration of their digipeaters. Such things as ID/NOID or LT buffers, BTEXT etc can be safely changed without leaving the warmth of your own shack. Yes, considering your environment is crucial when choosing an RTEXT string.

I'm sure someone will come up with a 'reason' why this isn't a good idea - but experience here hasn't shown one, yet.

Must admit, wish I could find a way to swap a PA by remote though....

73

Oh crap, I top posted too - sheesh

>*PROPERLY* implement this.

The best source of information is the APRS Specification because that
describes how it was supposed to be. The whole ID/NOID discussion is
because the implementation in the used TNC is not according to the
specification. My first implementations were not correct either. In the
earlier versions the rules were such that you could see which digi
*transmitted* the packet just like ID seems to do, instead of where the
packet entered the network.

I think if you can read the rules in the .INI file of DIGI_NED you get a
long way to get the most resonable implementation. That's not to boost
DIGI_NED in any way, it is just that these are designed after lengthy
discussions here on the APRS SIG and I just adjusted the rules until they
matched with the majority here. That is why it is the default that I ship
with DIGI_NED and if somebody doesn't agree or if his local situation
requires something else then the user has the power to change it anyway.

This would be a start. The next step is to think about it. If you find a
scenario that you are not sure of, just post it to the APRS SIG with the
alternative handling or your question and I'm sure you will get some
discussion here which will give you the most probable correct answer. Of
course there will always be different views so there is no static
implementation that will make everybody happy.

Last note, to handle WIDEn-N do not forget to add checking for duplicate
packets to avoid ping-pong effects, but I guess you already found that out
already... I think the TNC solutions remenber packets only a few seconds,
the default in DIGI_NED is 5 minutes.

Good luck! Kind regards,

Henk.

P.S. if Jnos is GNU source then feel free to steal code from DIGI_NED if
that suites you.

The syntax for the Kantronics digi command, whether you're local or remote,
is

UIFlood WIDE,28,NOID

73, Cap KE6AFE

Can you clarify this?
APRSdos sends a NEW packet (new meaning that the operator has made a change in it) once, then 16 seconds later, then 32, then 1 min, then 2 min, then 4 min then 8 min, then 16 minutes, etc.

This is fundamental to guarantee delivery of NEW information QUICKLY but to decay old data out of the system without congestion. If your DIGIS are not allowing redundant transmission, then that is undermining a fundamental principle of APRS. Unlike normal packet, APRS has no mechanisim for guaranteed DELIVERY. Thus, the network MUST SUPPORT multiple dupicate packets to improve reliability of TIMELY delivery.

APRSdos can support a very rapid message dialong in a tactical situation in the presence of lost packets because of this decaying algorithm. Unfortunaley, most people are not aware of this because WinAPRS only sends message packets once a minute. Thus, for every collision of every single packet, a full minute uis added to EACH line of text. This KILLS the ability to use WinAPRS in a LIVE tactical message scenario.

If DIGI-NED is further preevnting DUPES over 5 minut4e spans, this makes each collision delay messsage traffic by 5 minutes PER LINE OF TRAFFIC. Totally unacceptible..

Too many people missunderstand that duplicate packets are BAD. They are NOT. Duplicate packets are part of the APRS system to imporve delivery reliability. Can you clarify what you meant by your paragraph? maybe I missunderstood it..

Group

Anyone looking for a real-time Windows satellite prediction program might want to take a look at Sat_Explorer by Gabriel Rivat F6DQM. It will sound an alarm (can't get to work on my machine as yet) and pop-up if a Sat is near-by; you set the criteria. It can show the ephemeris for the current pass, the foot print on a world map and can track your antenna.

As I wrote this three Sats went by, alas, they were all a bit too low on the horizon.

http://perso.club-internet.fr/f1orl/index.html

Did I mention Freeware? Yep.

Best Regards,
Robert, KD6INI

You might check that you have disabled OS control of the USB port.
Not sure about Win98/ME, but XP has a checkbox where you can
allow/disallow the OS to control the USB port power to conserve
overall system power. If Win98/ME have this enabled, then your USB
port may be 'going to sleep' after some period of inactivity, and your
USB connected serial device will appear to no longer be connected.

Okay, that's what I meant to discuss scenario's. Its *much* more
complicated than just 5 minutes no-brains dupe checking...

First of all DIGI_NED makes an exception for messages; that is that if you
send a message or bulletin then that is only remebered a few seconds to
allow the decay algorithm to work. So message dialogs are not affected,
just type ahead. The dupe checking in the default configuration is 10
seconds. This will prohibit direct ping-pong but there is a risk of getting
a bigger loop.

What is left are the other types of data. Static beacons can only be send
every 5 minutes; but since they are static thats not a big problem (but
there is more, I will come to that below). If you make a change to it then
it will of course be send the first time in the 5 minute window. When you
need more frequent updates then either change the DIGI_NED configuration
(just change 600 seconds to 10...) or include a timestamp in the
transmission. That's a good thing anyway in this case since if timely data
is this important then you have to have some clue about the valididy and order.

Tactical data with more value is where vehicles are. But since the position
changes all the time, these packes are no dupes. Even then a vehicle stays
at the same location, variation in the GPS reading will make slight
differences to the packet.

But there is more. DIGI_NED also makes an attempt to detect if a packet is
an original. A duplicate packet is only duplicate if it is the *same*
instance of a packet that passed the digipeater before. Problem is, that it
is hard to detect if a packet is a retransmission or the same packet that
was repeated before; the two instances that just happen to look alike. But
we know for sure its a retransmission and not a dupe if the packet came
straight from the originator. So DIGI_NED examines if the packet already
passed a digipeater or not. When no digipeater in the list is marked as
"used" or when "n" is the same as "N" in WIDEn-N or TRACEn-N then the
packet can not be a dupe since it came directly from the originator - it

did not pass any digipeater so we could not have digipeated this before;
its not a dupe so this is digipeated always!

So if you send the same packet many times and the first digi you hit is a DIGI_NED digi then it will repeat *ALL* your packets. Only the next digi is not able to distinguish a dupe from a retransmission. But your packet at least will have passed this second digi (otherwise the second digi will not think its a duplicate) so it will at least travel 2 hops pritty reliable. This wat it will not distrub you local tactical communication - not even for pure static information - only a wider area communication is affected for static information. I think it is a decent workable tradeoff.

So to wrap it up; all data generated in the coverage area of the digipeater, all dynamic information and all exchange of messages and bulletins are not blocked in any way, while static clutter from a longer distance is surpressed and it still accieves its goal to prevent packets from looping.

You can even use this mechanism to reduce channel load. A few months ago we had congestion of our APRS QRG and we increased dupe-checking to 30 minutes. It worked like a miracle, all of a sudden the mobile stations became visible again. Of course it took 1 hour to get all the houses two or more hops away on the map, but these don't move and can be even read from a position file as well.

>reliability. Can you clarify what you meant by your paragraph? maybe I
>missunderstood it..

No, it only proves that there are no simple answers... So yes, if Maiko implements dupe checking with extended time then he has to make an exception for messages that use a decay algorithm and rely on repetition. He also may want to make a check if a packet is received directly - and therefore can't be a dupe but is a deliberate repetition.

I hope this answered your question.

Kind regards,

Henk.

BTW, there was an issue with Win98SE (seemed to be in 98 regular and ME, too) and certain chipsets (both Intel and Via) in regards to USB devices "disappearing" without any rhyme or reason. Microsoft had issued a patch at one point for it. It also seems to me that patch didn't work for a lot of people, including me. It seems to be totally random, you can have four identical laptops (or desktops) and only one of them will exhibit the behavior. Disregard Microsoft info about only affecting only VIA chipset with AMD processors over 350 MHz, it was a lot more widespread.

http://support.microsoft.com/default.aspx?scid=KB;en-us;Q240075

There was also an issue with tens of thousands (maybe more) of defective hubs/peripherals being made by Intel, they were branded mostly under the Entrega and then Xircom name before Intel acquired them outright, and I believe part of that USB hub/peripheral line went to Belkin... There was silent recall on them, but that ended over a year ago...I'm pretty sure. This affected all OS'es as it was bad hardware. I really do think Entrega looked at their liability on this issue and decided to call it quits. Reminds me of towns in the midwest changing their names after big Cholera outbreaks back in the 1800's. ;)

Also, make sure you have the most current drivers for your USB device...that seems to clear up most problems. Sometimes a motherboard BIOS update will clear up USB problems, too; unless you have my Tyan motherboard and then the BIOS update renders your USB ports dead...

Ev,

There are some other manufacturers (Symek and I believe recent MFJ
models) that have TNCs with stock hardware DCD which works quite well
with a receiver that has open squelch. Many others do need
modifications, however (TAPR has kits for this purpose).

```
> [NOID is] already there at n0zed-5!

I hope I did not make too big of an assumption.  I was in Colorado Springs
and from my motel room, all of the digis that I was hearing were ID.  And
remembering from a year ago's heated debate with the owner of many of the
ones in Colorado who insisted on ID, I assumed all the others were still
ID too...

Maybe I was wrong.  But never hurts to keep reminding everyone that NOID
is the proper setting.  The ID setting is only for RARE SYSOP testing.
That is why the default is NOID.

Thanks
Bob

> a few that didn't.
```

The important thing is to make sure all DIGIs are LABELED with the proper OVERLAY character or BText so there is no ambiguity to the users. If we can just get the SYSOPS to do that, then I am mostly satisfied since then the USER knows what is happening. So only report misslabeled digis...

OVERLAY	MEANING
R	RELAY ONLY
W	WIDE only
T	RELAY,WIDE,TRACE with callsign substitution
N	R,W,T and WIDEn-N with NOID
I	R,W,T and WIDEn-N with ID
U	all of the above with UIDIGI

If any digi has NON-standard alignments of the above, then the EXCEPTION should be listed in the BText, such as (NO-R) for no relay, etc...

157. [aprssig] RE: ID versus NOID digis

From: KC7ZRU - Tate <kc7zru@arrl.net>
Date: Sun, 10 Nov 2002 12:37:36 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS Special Interest Group <aprssig@lists.tapr.org>
Message-ID: <LYR842-106428-2002.11.10-14.21.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The default value of '30' is the number of seconds the digi will 'remember' any one particular posit string it digipeates. If another one just like it comes through within 30 seconds, it won't be digipeated.

Some areas have settled on a different traditional value - a difference of 2 seconds, but close enough so as to not be a great difference. Apparently there were trackers and such that would send out packets every 30 seconds - with no difference of position. The 28 value would 'kill' at least every other one and cut down on some of the bandwidth wastage, a bit.

158. [aprssig] Standard APRS Digipeater Overlays [was:RELAY in New Mexico]

From: "Ev Tupis (W2EV)" <w2ev@arrl.net>
Date: Sun, 10 Nov 2002 14:36:13 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106429-2002.11.10-14.24.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
> OVERLAY  MEANING
> R        RELAY ONLY
> W        WIDE only
> T        RELAY,WIDE,TRACE with callsign substitution
> N        R,W,T and WIDEn-N with NOID
> I        R,W,T and WIDEn-N with ID
> U        all of the above with UIDIGI
```

One may want to consider using X for eXperimental (NOT long-term) digipeaters
(and if you establish one, take responsibility for keeping your eye on it to
make sure the eXperiment is not killing the channel for everyone else). Be sure
to include an eMail address in the BTEXT, just in case the experiment's sponsor
needs to be reached.

Also...based on this...
> If any digi has NON-standard alignments of the above, then the EXCEPTION
> should be listed in the BText, such as (NO-R) for no relay, etc...

I would suggest that digipeaters that are running configurations that ARE
exceptions to the above, use a LOWER CASE overlay character as a designation
that observers really ought to look in the BTEXT for more information.

Lastly... no mention of TRACEn-N in the above chart. An oversight, or by
design?

Kind regards,
Ev,W2EV

The ## is the number of seconds that the system will apply the duplicate frame
checking subroutine. The higher the number, the longer the TNC will check to
make sure it hasn't already digipeated a frame before doing so again.

Lee,

Maybe "...the best designed and best supported APRS program there is!"
for the Windows platform. Would be more accurate.

xastir, by far, exceeds the 'bug fix' and 'new features' response time,
upgrades (usually at least weekly), flexibility (local map data, online
data and I've lost track of how many formats) and in my opinion,
usefulness of *ANY* other APRS client (and UI-VIEW is, IMO, the best
there is for the Windows platform!). Just that xastir was written for
the "*nix" world. But maybe with cygwin - may be useable on the Windows
platform as well.

Anyone tried yet?

Thanks for the info, Bob. I checked the Symek page and couldn't find any information on DCD. It may have been buried in the German somewhere. :o) I was amazed to see just how cheap those TNC's are! I'm amazed they haven't found a broader market in the USA.

The MFJ 1270c and 1274c manuals say things like "DCD is is optimized for HF operation". I don't know how/if it operates on VHF.

It would be interesting to put together a chart of TNC manufacturers and the functions that are important to APRS and "line 'em up".

I am trying to monitor my LOCAL situation and have the Internet available
at the same time yet I am inundated with junk bulletins most from Europe or
Canada. Why can't I filter all packets by RANGE or Callsign with wild
cards. This would enhance the utility of the Internet with APRS. I am
well aware of the BLNSKY and other ways to limit receptions but the method
seems backward to me. Why should the end user have to limit them selves to
only a single subset of bulletins and risk missing something important.

My suggestion is to implement both a range filter and a prefix filter. Let
me filter based on callsigns. Then I can eliminate the overseas junk
without killing the functionality of APRS.

Is there any way to filter this stuff out in APRS+ or UIview?

If you want to see what I am referring to check this link for a very brief
capture of the APRS SPAM.
Why must an end user be forced to view this type of junk?

I down loaded UI-View 16 yesterday. According to the help file I can add my
own maps in bmp format. I tried that but UI-VIEW won't list the map. I
followed the instructions and put it in the maps subdirectory and created a
inf file for it.. Does the program need to be registered first before this
will work. I like what I see so far but wanted to play with it before I
committed any dinero.

```

Users are going to have to carry a pocket dictionary just to figure out how their packets are being digipeated.

Why not keep it really really simple and just flag the WIDE digi's like the old days?

Here's a couple quotes from the FlexNet article in the current, http://www.tapr.org/tapr/html/Fpsr.html TAPR PSR issue:

"Never Satisfied
One of the long-standing gripes with all node software was the need to set parameters. Different regional groups would use differing sets of fixed parameters, thereby ensuring network incompatibility between regions. Trying to reach a common set of parameters was like arguing religion..."

And

"FlexNet tests each link every four minutes, automatically adjusting parameters and path qualities based solely upon these measurements. No parameters to set, no testing, no egos; it appeared to be just what we were looking for."

This sort of simple ease of use is what the APRS network should be striving towards.

73,
Bill - WA7NWP

For Linux and UNIX there is

multimon
http://www.baycom.org/~tom/ham/linux/multimon.html

Decodes many different digital modes via soundcard. For 9600 you'll
probably need to connect the soundcard directly to your receiver's
discriminator.

and soundmodem
http://www.baycom.org/~tom/ham/soundmodem/
(This also works with Windows)

For Windows, there is AGWPE
http://www.elcom.gr/sv2agw/

In APRS+SA, there are several ways to limit data. Position data can be filtered and/or deleted by Range. And Message data, on the tab which shows all messages, can be limited based on callsigns. For example, I can enter A* N* W* K* VE* VO* and receive only messages from US and some (most?) Canadian callsigns in the first slot on the Message tab. You can also enter callsign filters in the Ignore List on the Lists tab of Setup. But then that limits ALL data from those stations. Limiting the display of messages on the Message tab does not prevent you from receiving messages directed to you. It does in the Ignore List.

Actually, it is the opposite. By setting 28, the digi WILL allow a 30
second pos rate to get through. If the UIFLOOD filter was set at 30 then
someone doing a special event at 30 wouild get every other one filtered.

Oversight.  It should be in EVERY digi that has WIDEN-N capability so
thus, it does not need self identificaitn...

Thanks.

Take a look at Afilter. I think it will do what you want.

I agree that UI-VIEW and XASTIR are very well supported and good quality.
I run UI-VIEW32 and love it. Roger, G4IDE, is very active in supporting it
and adding
the updates users ask for....within reason. And, anyone can add "add-on"
programs to it.
I know nothing about UNIX based programs. I do have cygwin and...well, what
a nightmare for
a guy like me.
However, I know Curt, WE7U, is very active in supporting/updating Xastir.
Although I live in a real small world, without Roger and Curt, APRS would,
without any doubt in
my mind, be in a world of hurt for the majority of folks!
So if you run Windows, I suggest UI-VIEW32 with Pmaps.
If you run Unix, then I suggest Xastir and it's mapping compliments.

Jim, WA6OFT

What is the smallest H-T with external connections for hookup to a TNC/AGWPE?
Power level is unimportant to my search.

```
I use a Yaesu VX-1R as my 'base' APRS station. It's about 3.2" x 1.9" x
1", has 1/2 watt out on battery, 1 watt out with external 1amp supply.

Its 'hookup' is a 4-conductor 2.5mm (1/8") jack. Mouser Electronics
sells the plugs for this. I got the 4-conductor plug and a 1/8" mono
jack and 3/32" mono jack and created the familiar mic/speaker interface
that's common on so many other HTs.

I've considered using this radio in an all-in-one tracker with OEM GPS
board (from a Rand McNally gps for Palm), TinyTrak II, this radio, and a
battery pack, all in one box with a bnc as the only external interface.

Mine has been in use as my APRS base radio now for almost a year, with
no problems at all. Since the only digi in the area is less than a mile
away, it gives me the 'oomph' to be heard farther.

Make sure the INF file contains 3 lines,
Line 1 = Top Left Corner, Line 2 = Bottom Right Corner, Line 3 = Description
of map (What will show up when you list the maps)
ie for Arizona map...
36.30.6N,115.31.8W
31.49.2N,118.19.8W
Arizona

Note: the coordinates are in DD.MM.mmX format
where DD = Whole degrees
MM = Whole Minutes
mm = decimal fraction of minutes (Not seconds)
X = N,S,E,W

As I recall, I needed to shut program down and open it back up for the new
maps to show up. Then they were there after that.
Good Luck...Randy WB0SMX

Yes, it's that time again... I need help with something that is off-topic to the
list... but for which I believe someone can help.

*** Please reply directly, and not to the list ***

I need to generate a list of Internet domain names that exist that include a
certain word.  Example: "microsoft".  I want to see a list of every Internet
domain that includes "microsoft", including "microsoft.sucks...".  That sort of
thing.

I've got to believe that such a function should be possible.  Would someone
reach me directly with info...please?

*** Please reply directly, and not to the list ***
```

Thank you for your indulgence, Stan... and group.

Kind regards,
Ev Tupis, W2EV

I think this is part of the dump of internet weather data someone has been
putting on the APRS IS lately. Interestingly enough, it is not even a legal APRS
format, as the spec does not provide for weather data within the object format.
This is good though, I had to pay for storage of such data.

Personally I consider the routine placement of large amounts of weather data
which is easily available from many other internet sources to be an abuse of the
APRS IS, but since no one is in control, there is nothing I or anyone else can
do to stop it.

My personal preference would be to see the additional weather offered
from seperate servers and accessible to all who are interested.  That'd
include me, as I'm interested in it.

However, there are folks who use the system around the world who pay by
the byte, and they don't really care about a TCOON bouy off the S. Texas
coast.  I don't think they should have to incur that extra expense.

There was a lenghty discussion about this HT before on the SIG.  If I
remember they have a power save feature which can't be turned off and it
renders them poor performers for APRS/Packet.

Hi Ev,

The Symek model I am referring to is the TNC-2S.  It uses a 3105 as the
modem but also has an XR2211 chip which is used only to derive DCD.  It
worked great for me.  I just checked the Symek web pages and apparently
the TNC-2S is no longer being produced.  The description of the 1200
```

baud AFSK modem for the TNC3S and TNC-31 indicates that the 2211 DCD
circuit is used in these also. The description of the TNC-21 (which
appears to have replaced the TNC-2S) in German (aber meine deutsch ist
nicht so gut) also mentions the XR2211, so it possibly uses the same
circuit.

I haven't actually used a 1270C and don't have any details (the manual
is on MFJ's web site, but does not include a schematic), but understood
that the DCD revisions were based on N7CL's PSR articles (these
improvements, which help both HF and AFSK DCD are included in the TAPR
XR2211 DCD mod kit). The DCD circuit in the original TNC-2 demodulator
design (e.g., 1270B) works fairly well for open-squelch operation for
many radios, but as well for others (it depends on the noise
characteristics of the radio).

Actually Eric came up with a much simpler mod for AFSK only (non-HF)
for the TNC-2 which involves only two resistors and a capacitor. I
don't think this was ever published in PSR, but it is documented in
N7OO's manual for TheNet Plus. I have used this on several 1270B TNCs
and it works quite well with open squelch.

TNCs using the TCM-3105 chip (or the AM-7910) must use the squelch in
the radio unless they have the TAPR state-machine DCD circuit or some
other way to derive a valid DCD signal (as does the TNC-2S). The 3105
was designed for telephone-modem use and its DCD cannot adequately
distinguish between noise and a data signal. As most of us are
well-aware, radio squelch circuits are typically fairly slow and
require longer TXD settings in everyones TNC.

I recall seeing somewhere a reference to a version of KISS which
includes software DCD, but I am unable to locate this (I believe it was
done in Japan) and do not know how well it performs.

There are presently two servers that provide the additional weather content
in addition to the standard APRS IS feed. This includes RAWS, Buoys,
Ships, Fires, River flow information, Iowas's Roadway Information weather
system, Iowa SchoolNet weather etc. with more to follow. This information
is of interest to some Emergency Management and various public agencies.

AFAIK this information is not sent to the APRS IS on a regular basis. The
R327CA1D2 listing on findu is 7 days old and I am told it was sent to the
IS in error.

Refer to page 64 of the spec, "Complete Weather Report Format--With object and lat long position"

> Personally I consider the routine placement of large amounts of weather data
> which is easily available from many other internet sources to be an abuse of the

Citizens weather is also available from other sources on the Internet. Are you suggesting that CW has
no place on the APRS IS as well?

I stand corrected...the Object section of the spec makes no mention of weather
data (but does mention every other form of data that can go there), perhaps that
ought to be corrected...

I have been seeing some calls that have gone by in the past few months and
was curious, does the APRS format allow the use of tac call signs? I have
seen a few that have been Tac-1 and Tac-4 but no call attached to either of
them. Lookup on findu revealed that they are mobile stations and did not
respond to messages so I am going to assume that they are dumb trackers. Is
there somewhere in the protocol that there has to be a call sign attached to
them if they are using the ham bands? Need the information if someone can
enlighten me.

Earl,

This is a RAWS (Remote Automated Weather Station) either owned by the BLM or the USDAFS. APRSFIRENET sends this and other related type data, such as Wildland Fire, Earthquakes, RWIS DOT stations, Ocean going ships and Buoy's as well as land based U. S. Coast Guard C-Man stations, etc. to two servers (and more on the way) that are not the APRS-IS. APRSFIRENET does have the ability to send this type of information out to the APRS-IS and this was tested about two months ago. About a week ago RAWS data was sent to the APRS for a short period due to a configuration issue which, once found, was immediately corrected.
The Data you see on the APRSFIRENET is available NO WHERE ELSE IN THE WORLD in the format it is presented in and as a whole. Although some people say it is readily available elsewhere, it is not available in the APRS format (even if it is modified to work), nor is it available, generally in such a timely manner, usable by mobile RF units or to the APRS community as a whole.
APRSFIRENET is a new network. It includes the APRS-IS feed. It is made up of people that are in public service, have an interest in public service.
You can see more information about APRSFIRENET at www.aprsfire.net or www.wa6oft.com
APRSFIRENET has a good group of people working on this project and the response is very good for those that are interested in this sort of thing.
It is not for everyone, obviously.
Hope this answers your question.

Steve, many of the CW stations (about 600 total CWOP stations...hams and non-hams) on the APRS-IS are non hams. A very large percentage of CWOP stations are in fact, WXFORYOU stations, which is another Meso provider. Not only are the CWOP stations WXFORYOU stations, many of them are volunteer stations for WeatherUnderGround. And, the WXFORYOU stations are increasing as are the WeatherForYou stations. So, in a sense, this data is available elsewhere on the web. I do not know if you are aware of this or not or if you care. However, I do support the CWOP effort.

I recently succeeded in gathering everything together that I needed for my dream station.

I run an Alinco C1 credit card radio, Heath Pocket Packet TNC and PocketAPRS on Palm IIIC. (No GPS .... yet) It works great and the whole "station" fits nicely into small camera case.

Power save and auto power off can both be disabled on the C1. With just a 3 inch antenna and 300mw of power, you don't want to be too far from the local digipeater. I'm about 3 miles away and it works great.

> Steve, many of the CW stations (about 600 total CWOP stations...hams and non-hams) on the APRS-IS are non hams. A very large percentage of CWOP stations are in fact, WXFORYOU stations, which is another Meso provider.

I operate the CWOP program and put much effort into eliminating duplicate postings to APRSWXNET and WeatherForYou because duplicate postings of data from the same stations cause considerable difficulty with our quality checking algorithms. While there may be some duplicates, we work hard to make sure that each data source is in either one or the other, but not both.

> Not only are the CWOP stations WXFORYOU stations, many of them are volunteer
> stations for WeatherUnderGround. And, the WXFORYOU stations are increasing
> as are the WeatherForYou stations. So, in a sense, this data is available
> elsewhere on the web.

The APRSWXNET/CWOP data set, which is distributed widely to many different government organizations, is not available anywhere else on the internet. The APRS-IS acts as the data collection part of the APRSWXNET/CWOP data set and is not the data distribution part. The data distribution part is called MADIS. There's more information on this on www.wxqa.com

Some of the stations may also post to Weather Underground, but none of the Weather Underground data is acquired for the NOAA mesonet data set.

>it is readily available elsewhere, it is not available in the APRS format
>(even if it is modified to work), nor is it available, generally in such a
>timely manner, usable by mobile RF units or to the APRS community as a
>whole.

Let me explain further. From early in the APRS IS's history, I received requests from people that wanted to reformat data from commercial and government sources and add it to the APRS IS stream. While I was managing the APRS IS I looked at each of the requests individually, based on the load on the server, the ease of getting the information elsewhere, and the utility of the data.

An easy decision, for example, was Dale's server that gates the EMWIN warning data. While the volume at times could be high, it had the potential to save someone's life. A harder example was the quake server...it puts out very little data, and although I could see little utility for announcing where those equakes were (of course I live in an area not prone to earthquakes) I allowed that use. The Citizen's weather data was very useful, and available from no other place, so I allowed that.

On the other hand, the most common request, which happened at least 5 times, was people that wanted to take weather data from the NWS and reformat it into APRS data. This data is readily available from hundreds of web sites, NOAA weather radio, and broadcast outlets. The volume of the data could be quite high, and the latency longer than typical in APRS. Therefore I said no each and every time.

Once the APRS IS was no longer managed, there was no way to keep people from doing this, and in fact several people have done it. So far, these are used for localized areas, the impact on the APRS IS has not been large, but if, for example, someone were to dump the full FSL Mesonet feed, the effect on the APRS IS would be severe. Someone writing such a program could truthfully say that the data "is available NO WHERE ELSE IN THE WORLD in the format it is presented", but that would be little consolation for the damage it would cause to the APRS IS.

I had not heard of APRSFIRENET before today, and I do not have any problems with it as it is apparently implemented. My concern is with undisciplined, large scale gating of data. And if I understand what you have said, this data is intended for mobiles and therefore must on RF. I have never had ANY concerns about (or attempted to excercise any control over) RF data that is sent to the APRS IS. The principle purpose of APRS IS is to gather the data from RF around the world...if a locality sees fit to send data on an RF APRS channel, it absolutely, positively belongs on the APRS IS.

MFJ-1270C is, of course, a TAPR TNC-2 clone with (a supposedly) improved DCD circuit. I believe there is a schematic of that circuit in the printed manual...

I use a 1270C with the (buffered, mic jack) discriminator output of my Icom IC-229H. DCD on the 1270C works much better than I expected. I had been using AEA TNCs which might as well have not bothered with a software DCD. There have been times when I thought the 1270C's DCD could be a little better; but maybe only a little better.

I've had good luck with an HP-100LX palmtop. HP-200 would be even better. HP-95 has a smaller display and thus won't work for APRSDOS. Newer machines are WinCE devices and thus won't run DOS applications.

Ahhh, but there are DOS emulators for PPC and WinCE machines...

There are any number of smallish 386 and 486 Palmtops, like the Gateway Handbook, that can still be found, if you shop around.

I've seen the old Toshiba Librettos sell for as little as 100 bucks...usually the go on eBay for less than $150.

I may have a few micro-footprint POS 486's laying around in the garage...   No built-in display, and they run on 120 volts. But they are small.

I while back, the place I used to work was dumping out SBC's. These were Lanner EM-520 boards. Essentially 180MHz Pentiums with video, sound, 4 com-ports, USB, Network, printer.... In fact, just about anything you'd need, or want, on a single small PCB. The only thing they DIDN'T have was TV out (they were a custom build) and they only had ONE IDE channel (as opposed to most motherboards that have two). They DID have VGA and even an LCD panel driver.

I can check to see if more are still available if you want. I'm pretty sure they are. At the time, they were dumping them for $75.

Oh, they would boot DOS and Linux, but if you booted WIN98SE then you could bring up full USB support and the network.

Mike

As implemented, APRSFIRENET cannot be selectively gated to RF as it generates objects from the same source station. The information which Dale's weather server generates can be selectively gated. I have recommended on the Specification SIG that designers of these special information servers consider implementing a pull type of information flow instead of a push information flow. For instance, Dale's server would still push (broadcast) the abbreviated watch, warning, and information messages but would only broadcast verbose messages in response to simple queries. APRSFIRENET (FIRE) could respond to a query with a message (or messages) containing the requested information. This would not preclude the current configuration where someone wanting the full APRSFIRENET feed can connect directly to the APRSFIRENET server. In fact, that would be encouraged.

Servers using a push-pull method might be the WXSVR and QUAKE (earthquake information would only be repeated upon request). Servers using a pull method might be METAR, FIRE, BUOY, RADAR, etc. As explained on the Specification SIG, the queries would be short APRS messages allowing things such as latest, nearest, within range, etc.

By approaching APRS-IS information dispersal in this manner, we reduce the overall load on APRS-IS, increase the availability of information that might be useful to RF stations, and the server designers will get a better idea of how many people actually desire the information they disperse. This last part will help them determine what and how the best method of dissemination should occur. Even the Citizens Weather could be done this way with findu connecting to the "CWOP" servers.

This approach keeps APRS-IS as an effective high-speed backbone between APRS RF networks around the world while giving the RF user selective access to local information such as weather via APRS messaging. By moving all of the broadcast information, such as CWOP, METAR, etc., to their own servers, the load on APRS-IS will be dramatically reduced yet the data will still be available to RF via queries. The CWOP information would also be available to findu via findu connecting directly to the CWOP specialized servers.

I will also make this offer to those designing specialized servers: I will be glad to design a Java "front-end" which will act as a query processor. The "front-end" would go between the specialized server full dump port and APRS-IS. This would require, however, some consensus as to the queries and the format of the responses. That discussion, I think, would be better handled on the Specification SIG as it would affect most future specialized server development.

Yes, the APRS format allows tactical callsigns. This is a debate that comes up periodically. I believe the most practical position is that if the operator is putting his callsign in a packet somewhere, he's most probably legal. The best place to put a callsign would be in a periodically-transmitted (once every 9 minutes or so) status message.

Hi All-
Murphy's Law predicts the day I take the WXSVR down will be one of the worst weather severe wx days of this year. Luckily I was able to move the DSL line to another room and fire the sever up again -if somewhat cramped. The log looked like hundreds of severe thunderstorm and

tornado plots over the last 24 hours. I have no way of viewing this graphically for the next few days. After I get the ham room back in operation I will try to post the log someplace for demo purposes.

Steve, One of the intentions is that it "can be used" on RF. This RF may or may not be "ham" radio.
Normally the APRS-IS will NEVER see this data because it is not part of the APRS-IS.
APRSFIRENET's main intention is public service. Pending approval, it will become part of the USA
Homeland Security system. Some of it already is.

It is a whole 'nother network that is compatible with APRS client software.
It is availible to those
that are interested in seeing more that what is on the APRS-IS.

As implemented, APRSFIRENET cannot be selectively gated to RF as it generates objects from the same source station. The information which Dale's weather server generates can be selectively gated. I have recommended on the Specification SIG that designers of these special information servers consider implementing a pull type of information flow instead of a push information flow. For instance, Dale's server would still push (broadcast) the abbreviated watch, warning, and information messages but would only broadcast verbose messages in

response to simple queries. APRSFIRENET (FIRE) could respond to a query
with a message (or messages) containing the requested information. This
would not preclude the current configuration where someone wanting the
full APRSFIRENET feed can connect directly to the APRSFIRENET server.
In fact, that would be encouraged.

Pete,

APRSFIRENET has not been involved with these discussions, as far as I know.
Please do not let APRSFIRENET stop you from developing what you want the
APRS-IS to be.
Because APRSFIRENET is not part of the APRS-IS and has nothing to do with
TAPR,
I am not going to respond hereon this issue any further.

Jim, WA6OFT

SPECIAL PCsat Test:

I just activated the SPECIAL STORE-and-FORWARD mechanism on PCsat that will let it capture packets over completely isolated parts of the world and then regurgitate them at regular intervals around the rest of the world. The donwlink is on 144.39 and the TX rate is once a minute.

And with seconds to go before LOS, I finally got re-configured to send such a a packet. If this system works, then you should see my packet on 144.39 over the next day. The packet should be something like this:

From: WOCALL   (oops, didnt check the MYCALL till after the pass)
Position comment: PRIORITY
Icon: W
Status Text: empty

Ill try to do better next time...

The purpose of this mode is so that persons walking about Antarctica, or swimming in the South Pacific or South Atlantic will be able to have some priority message abiility via PCsat type satellites.

The uplink for this capability is the unpublished uplink for special remote travelers. If you are in this category, contact me for access. This mode will only last for a week or so until PCsat goes back into eclipses.

On Sun, 10 Nov 2002, Steve Dimse wrote:

> putting on the APRS IS lately. Interestingly enough, it is not even a legal APRS format, as the spec does not provide for weather data within the object format.

For clarification, an OBJECT by definition was intended to be a means for transmitting any other type of APRS position report data, so anything that is permitted in a position report format, was intended to be able to be transmitted in an object report transparently.

Thus an OBJECT can contain weather, DF bearings, Omni-directional signal strength reports, PHG data, and of course CSE and SPEED data, and any other field defined for any other position report format. The fundamental idea was once an OBJECT is detected, then simply take the object name, and then shift left 10 bytes, and the result is a legal APRS position format that is then sent over to the position-format-parser..

The spec did not do a good job of conveying that transparency...

Bob, WB4APR

You are correct.  You have not made any attempt to enter into
discussions about how to make the information on APRSFIRENET available
in a useful manner to the amateur radio APRS community.  However, data
inadvertently inserted onto APRS-IS from APRSFIRENET was how this
discussion began.

> developing what you want the APRS-IS to be. Because

Not what I want it to be, what APRS-IS has become: a high-speed
worldwide backbone between amateur radio RF networks.

> APRSFIRENET is not part of the APRS-IS and has nothing to do
> with TAPR, I am not going to respond hereon this issue any further.

So, from this statement we are to gather that APRSFIRENET is now a 100%
government/commercial venture with no connections to APRS-IS (including
feeds from APRS-IS)?  If this is the case, you might want to verify
licensing agreements of the client software and of the APRS trademark
for government or commercial use.

It is a pity that your organization will not communicate and discuss
methods of making this information available to the amateur radio
community in a usable form.  I am sure there are some hams on RF that
would like to be able to query for this information and your
organization's experiences would be a valuable contribution to how this
could be done.

Good luck on your endeavors.

I instigated such a discussion on the Alinco DJ-S11 (the $88 FRS looking
like radio), but I don't remember whether anyone mentioned the credit
card radios as having the same problem.

The solution is to hold the squelch always open and then run software DCD
if your TNC can do it...

I am curious to konw about the power saver in the credit card radios?

Bob

I just checked with a friend that has a dual band credit card Alinco and he
says that you can indeed turn off the battery saver! Push the "Function"
key until the BS comes up, then up or down arrow to turn BS off or on.

It worked. On the next orbit, I saw WOCALL in the 144.39 downlink. And
so I also changed my call to correctly WB4APR and sent another packet.
Now you should see both. The buffer is currently TWO deep so that two
wilderness travelers can be so reporting.

I will be gone for two days, so anyone who has used the special uplink in
the past is welcome to experiment with it also...

There is pocket DOS for the Win CE platform that will run on the CE side for
dos applications. Would recommend a CF card as it takes up a lot of memory
though.

OK that solves a few questions, but the stream that I am seeing does NOT
have a call sign attached anywhere in the stream, so how does this work in
the regards of using it on the APRS freq? I have to correct myself the calls
were PACK-1 and PACK-4 not tac as my email indicated earlier.
Thanks.

The easiest way is just to activate your CW ID.

It won't showup on the I'net, but will on RF which is what the
FCC is concerned with.

> Is there any sound card packet program that
> does 2400ba and 9600ba packet ?

Another Windows goody is FlexNet32 (the 32 bit version of the original PC/FlexNet stuff). Complete with Thomas Sailer's soundcard drivers, this is awesome stuff, even includes FULL BLOWN tcp/ip network interfaces.

The URL is as follows :

   http://www.afthd.tu-darmstadt.de/~flexnet/index.html

You can change RF speeds, and you have several different modulation choices at your disposal. FlexNet comes with it's own trace window.

Best regards,

Maiko Langelaar / VE4KLM

But has anybody actually succeeded in running APRSDOS there?

I know it runs on the Dos Emulator under Linux...

Bill

224. [aprssig] Re: Tactical call signs?

From: Phil Reed <preed@dnaco.net>
Date: Mon, 11 Nov 2002 12:28:50 -0500

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106572-2002.11.11-12.15.40--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
It's possible to put the callsign in a packet that would not be picked up
by an APRS gateway. It's also, as another fellow pointed out, to use other
techniques like a CW ID, that would also not get picked up by the gateway.

Remember, what gets carried on the APRS data stream is *not* what the FCC
looks at for legal identification purposes. Amateur radio regulations do
not apply to the Internet. When I transmit for APRS, I am not required to
ID in such a way that the APRS network infrastructure understands it. My ID
is only required to identify my station in terms of RF emissions, and I can
use any legal way to do it, including code or even voice if that's what I want.

So, relax. Let the owner of "PACK-1" and "PACK-4" worry about meeting his
own ID requirements.

>OK that solves a few questions, but the stream that I am seeing does NOT

My Jornada will run APRS DOS under the pocket dos window with no problem,
Just got done reloading the system onto my jornada for a test and it works
fine. No problem here for the win CE version in dos or the actual CE
platform.

>Bob, why the distinction for UIDIGI? I would guess (and Henk can probably
>clarify) that Digined would also handle all of the above as well.

I have in my change-log for the next DIGI_NED version:

<quote>
- Changed the template beacon to have a star with an overlay "D" for
   DIGI_NED as per suggestion of Bob Bruninga on june 23 2002 on the APRS SIG.
</quote>

So I assume Bob just forgot to mention it, see below...

Its good if the user knows its a DIGI_NED digi because then they know that
it also supports digipeating on destination SSID and that you can throw
messages at it like "?MH", "?DX" and many more (uptime, owner, query "tiny
web pages", satelite server or whatever the owner configured).

Kind regards,

Henk.

Subject: [aprssig] Northeast Digipeater fix up...

The correct overlay characters are:

   R if RELAY only
   W if RELAY and WIDE
   T if RELAY,WIDE and TRACE
   N if WIDEn-N (and relay,wide and trace)
   I if WIDEn-N (and realy,wide and trace) but ID is set to ON
   J if Just WIDEn-N and no others supported
   U if UIdigi
   D if DIGI_NED software

Yes, I remembered incorrectly,  If we agreed to "D", then that is a good
choice also.  Thanks

 From the PocketDOS website (www.pocketdos.com):

PocketDOS is an MS-DOS 6.22 compatible DOS for your Microsoft Windows CE or
Psion/Symbian EPOC32 based Pocket Computer.
In addition to a full DOS, PocketDOS lets you install and run many DOS
programs* on your Pocket Computer.
```

PocketDOS also lets you access devices such as touchscreens, built-in and
external modems, IR ports, flash disks, network drives,
printers and more from within DOS and DOS programs.

$40.00 for the full version.

I just tried it with my DJ-C5. Do the following: Press the Function button
until F starts flashing on the lower right of the LCD; press the DOWN arrow
("bS .on" or "bS .oF" will show); press the up or down arrow to change;
press the F key again or PTT completes the change.

Page 65 of the spec (75 in the acroread PDF reader), "Complete
Weather Reports with Timestamp and Position" says: "An APRS Object
may also have weather information associated with it."

So, it _is_ in the spec here and there, but you really have to dig
for it!

Thanks for the information! Personal tracker here I come! I found a small
arm pack that holds the handspring with TNC, the HT and the Etrex all in a
neat package that fits on your arm. to be able to get the signal out with
the 300mw that the HT puts out. I will see about getting some pics up on my
site if anyone is interested in viewing it.

> the world...if a locality sees fit to send data on an RF APRS channel, it
> absolutely, positively belongs on the APRS IS.

Please correct me if I'm wrong here.   Scenario: A station is
connected to FIRENET and gating a few objects for their area to RF.
These objects will NOT get gated into the APRS-IS stream (by Igates
in the area) because it's obvious from the path that they were
already gated to RF. Right?

At first I was thinking there might be a problem developing, but
these objects should have "TCPIP" or "TCPXX" in the header which
should prevent all igates from gating the packets into the APRS-IS
stream. This was an anti-looping measure which just happens to work
to FIRENET's advantage as well.

Note that I support FIRENET in spirit, with object generation, and
with coding. I'm biased. Who isn't?

No, not because of the path. If the packets being gated to RF are in third party
format they will not be gated back to the APRS IS.  The packets that started
this conversation, however, were objects, and if they were sent on RF in this
format they would be gated back to the internet. The new Q construct also has
the ability to be used to prevent this, but I do not know if any IGates even
implement this yet, certainly the vast majority of deployed IGates will not
check this.

I'm not sure of the way these packets are being generated and/or transmitted to
understand what the "misconfiguration" that sent them to the APRS IS, or what
mechanism FIRENET uses to gate packets to RF.

No, TCPIP or TCPXX are for differentiating between packets from validated and
unvalidated stations, needed to decide what packets can be gated to RF, not to
the internet.

Dear Peter,
You've got the idea!  That's what I'm trying to create, but with a laptop,
rather than PDA.  I've avoided the PocketAPRS product because I've heard that it
was too limited for what I need.  Maybe I should ask the questions that will
clarify everything for me...

Will PocketAPRS allow the sending and receiving of "operator-to-operator"
messages?
Does it support grid square position determination and Grid-formatted TX's?

Ev, W2EV

On Sun, 10 Nov 2002, Spider wrote:

> However, I know Curt, WE7U, is very active in supporting/updating Xastir.

Plus Plus Plus:
---------------

*) Nine additional developers who work on different portions of
Xastir.  Not all are active right now, but we have faith in them!
The work gets done.

*) Frank Giannandrea, KC2GJS, the guy who started these shenanigans
by initially coding/supporting it (He should be listed first!).  We
hope to see Frank active again in the future.  It's to be noted that
he went through a lot of hassle just to create the first open-source
APRS program.  I get the idea that there might have been a lot of
ill-feeling towards the project at the beginning.  Hey, probably
still is!  Why would anyone GIVE IT AWAY when they can sell it?  ;-)
Frank got through all that and released something that worked.  He's
a pioneer.  Thank you Frank!

*) Users who submitted patches and had them accepted by the
development team.

*) Users who submitted bug reports/tested the fixes.

*) Users who support others on the Xastir mailing lists.

*) Users who submitted features requests.

*) Those who wrote open-source libraries that we could build upon.
There are a _LOT_ of them.  Most had no idea what uses their
libraries could be put to.  Most of these people don't even know
or care what APRS is.

*) All who said it couldn't or shouldn't be done.  That makes
open-source coders work all the harder (Something in the water I
think, or perhaps a missing gene).

*) All who supplied free pizza and beer to the developers when they
drove through their area (Okay, that hasn't ever happened, but I'm
kind'a hungry right now).

You see?  Open-source gets complicated.  You can't point your finger
at (or even just "finger") one person.  The responsibility, blame,
and workload get spread across many individuals.  In this case
probably thousands, although most contributed to libraries that
Xastir links with, and not Xastir directly.  They still helped us.

The _really_ good thing is that the code and the algorithms can
outlive all of the people that are currently contributing.  Other
works can be based on Xastir code or portions of it as the licensing
allows.  The licensing encourages sharing of code across
similarly-licensed works, and keeps the source code available.

Please don't give _me_ any credit for Xastir as I'm just a
worker-bee.  One of thousands.  Credit to Frank and his cast of
thousands!

Sorry!  I had done a quick check in the Xastir igate sources to
come up with the sentence above.  Since I didn't write that portion
of the code I didn't remember the rules.  The fact that they are
third-party packets is adequate to describe the problem _and_ the
solution.  Thanks for pointing that out!  No problem here.

Xastir does look for the initial '}' character and refuses to gate
those packets to the 'net.

It looks like at least one of the APRS clients _is_ gating
third-party packets into the internet though!

After reading posts I have decided that a palmtop computer would work best for what I am wanting to do.
  If anyone has one they would like to sell I would be interested.  I am looking for something that will
 run DOS (without an emulators preferably).  I would like the size to be around 4X6X0.5 or so (I think
that is the standard size).  Price range is anything below $150.  If that is too low for something like
this let me know.  Also if anyone has any suggestions with interfacing to a TNC that would be
appreciated too.  Again please respond to kc0idi@arrl.net

Thanks for everyone's help and for the bandwidth.

Are you talking about the packets that are under discussion here, like

```
RAWS-1>APRS,TCPIP*,qAS,WA6OFT-15:;R327CA1D2*032218z3339.08N/10419.33W_010/
011g016t050h51F051RAWS NM_EIGHT_MILE_DRAW
```

These packets that began this discussion are NOT third party packets, which is why I was hedging about how FIRENET gates data to RF. It is quite possible to use a TNC in KISS mode to gate packets to RF without using the third party format. This is why the q construct may become the preferred method for preventing a loop, however at this time it cannot be relied upon, as few deployed IGates would correctly filter these packets.

240. [aprssig] Lightweight low-power SSTV encoder

From: "Mark Conner" <n9xtn@cox.net>
Date: Mon, 11 Nov 2002 21:53:11 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

Rendered body type: text/plain

I'm looking for an alternative to the Kenwood VC-H1 for converting NTSC output from a camera into SSTV audio tones that could then be fed into an HT. I'm wondering if someone out there has come up with something PIC-based that might be able to do this.

This is a project that would fly on a balloon-borne APRS payload, so computer-based solutions are out (weight should be < 1 lb with batteries). The VCH1 is a bit heavy, expensive, and power-hungry for this application. I don't need to receive/decode/display SSTV for this, either.

I think something like this could have wide APRS applications, like Bob's APRN concept. With many color cameras available for <$100, a $50 SSTV encoder kit would be a powerful addition. Several roving units with APRS trackers could be sent to the field and beam SSTV pix back to a central location by simplex or possibly through a repeater.

There is another scan converter that is based on the same Tasco chip.
http://www.svs.net/wyman/products/tsc70.htm

Not exactly what you're looking for though.

>I think something like this could have wide APRS applications,
>like Bob's APRN concept.  With many color cameras available for
><$100, a $50 SSTV encoder kit would be a powerful addition.

Capturing the video frame would be the challenge, I've never seen how this is done. You'll need more
than just a micro, even an AVR alone isn't going to handle this.

I like the APRN concept, but it needs a bit more work, so that the pictures are always tied to the
position of the sender.
I've heard that there's some standard for putting the ID in the picture, which would help a great deal.
Possibly you could jam a position in there too, which would be just about ideal.

Yes I am.  And many other types.

> These packets that began this discussion are NOT third party packets, which is
> why I was hedging about how FIRENET gates data to RF.

Right now the packets you see on the 'net are not gated to RF except
for perhaps testing purposes (to the best of my knowledge, someone
may correct me).  When they are gated to RF, I expect that they
_will_ be in third-party format.  I see no reason to do anything
else.  Actually I see good reasons _not_ to do anything else!

>  this.
```

This is far beyond the capability of a PIC!   This task is orders of magnitude more demanding than manipulating the couple dozen ASCII characters required to assemble a APRS position report from a GPS.

The essence of SSTV scan conversion is to run standard NTSC analog fast scan (30 frames/second) TV into an analog-to-digital converter, store one fast-scan field (262 lines) into RAM in one 60th of a second, then clock out the data over 30-90 seconds into an digital-to-analog converter that modulates an FM audio tone.   Receive merely reverses the direction of the process -- barely any more circuitry is required.

The frame grab represents roughly 240 lines of 320 pixels each. Each pixel requires 3 full BYTES (not bits) to represent it's red, green and blue values at 8-bit resolution. Each raw frame grab requires (before data reduction and compression) 240 lines x320 pixels/line x24 bits per pixel, which equals1,840,200 BITS of data (about 240 KBytes of data...   WAAAY beyond the capacity of the postage-stamp-sized 1K/2K/4K ram in a PIC.   The VC-H1's computer endowment (CPU horse power and static RAM capacity) is more like a PDA or Pocket PC than a PIC!   A board-level project for this kind of device is going to more resemble a KPC3 than a Tiny Track

The other issue is the power consumption. The real power hog isn't the CPU and RAM; it's the CCD imager. The VCH-1 and early VGA-res digicams like the Epson "Photo PC" completely drain a set of four AA batteries in little over an hour with the CCD on. [The VC-H1 runs about 10 hours with the CCD imager off.] If you wanted to do something relatively exotic and bleeding-edge, you could use one of the upcoming CMOS imagers that will use somewhere around 1% of the power of current CCDs.

The standard Etrex (in the US) does not support NMEA in. However, the Legend and Vista do. I used a standard Etrex through this spring with good results (but no waypoint mapping). I "upgraded" to an Etrex Legend with the latest firmware this summer and have used it extensively with my TH-D7. The D7 has the WAYPOINT menu item set to 9 digit NMEA and the GPS set for NMEA. The Legend is set for 4800 NMEA In/Out.

One tip about using the Legend or Vista in this configuration: when manually entering waypoints into the GPS (to mark schools, intersections, etc.), change the waypoint symbol to something other than the default dot. This is because all of the stations received from the TH-D7 are created with the default dot symbol. The Etrex has the ability to erase waypoints by symbol. This way, when you start a trip, you can erase all the stations you received last time in one step without affecting your "permanent" waypoints.

Have fun.

I like the idea, as well.

For putting positions/id's in a picture here's a link. The input is RCA video and the output is RCA video, so it can go between a camera and the VC-H1. If you're ever get to Hamvention,
this guy always has his model airplane video there (which uses ATV, not SSTV). It's pretty neat.

How about just inserting the time and lat/long into the overscan lines of the video frame. Arn't there about 20 lines available for time signals, etc. in the NTSC signal being used by the netrworks? The frame thus isn't compromized (data superimposed seems to cover just what one wanted to see), and the data can be used to correlate information for post mission re-creation. .

This is exactly what I do with my "SSTV Mobile LiveCAM" mounted on the dash of my car. I use a similar NTSC-in/NTSC-out title generator from Decade Engineering called "Bob-II". I have the device inserted between a digital still camera with an NTSC monitor output, and the VC-H1 external video in connection. Right now it just overlays "WA8LMF Mobile LiveCAM" at the top of the screen and "http://WA8LMF.COM" at the bottom, but one of my intended projects is to come up with a Basic Stamp controller that would overlay GPS coordinates on the image.

The unit is packaged in a module the size of a 30-pin SIMM memory module (and fits into a SIMM-type socket). Information at:

If anyone has a recommendation for a FRS radio which will transmit one PL tone and recieve another different PL tone, or receive a non-pl signal and will still TX a PL, please contact me off list.

Wes

1) You need a closed-captioning-capable TV to recover them

2) The data would be lost in a fast-scan to SSTV conversion (unless it was extracted with a close caption decoder and re-overlaid somehow).

The captioning data is on line 20 (I think it's actually line 10 of the even field -- not sure) which is normally overscanned off the top of the screen of regular TVs. If you have a TV old enough to have size or hold controls, you can roll the pic and see a line of shimmering black and white dots above the top of the pic (The closed caption data stream is actually sent as a line of black and white pixels representing binary 0s and 1s.)

SSTV scan converters such as the TASCO (and the Kenwood VC-H1 which is actually based on the TASCO chip by the way) normally only take the middle 240 lines of a 262-line field.

Isn't there an SSTV equivalent to this, "CID"?
I've been looking for info on this, but haven't found any.

This works, but it's only human readable.
I would like to put at least some of this info into the SSTV CID so that the frames can be stored under indexed filenames.

UI-View32 only support Precision Mapping. If you have version 2.39, you have the 16 bit free version. The 16 bit version will not support CD mapping products on a dynamic basis and probably does not support PM at all. Pay the whopping $15 registration fee, get the 32 bit version and use it with PM5.0 Great program and Roger adds features all the time. I think it is one of the best supported APRS programs around. When roger added PM as an option, it became the only APRS program that I use.

This ID vs. NOID setting is only an issue for Kantronics TNCs in service as
high-level APRS WIDEn-N digipeaters.  In those digipeaters, the TNC should
be set to UIFlood WIDE,28,NOID
Only the WIDEn-N digipeater sysops need to be concerned about setting NOID
vs. ID.

UIFlood should be left disabled <UIFlood %> in _all other_ APRS stations
using Kantronics TNCs.

Hope this helps.

You are correct, CC is sent through the VBI (Vertical Blanking Interval or Interleave - deping on who you talk to) and is not sent over ATV or SSTV. Incidentally, many cable TV providers also strip this info from their signals, which is most annoying.

The PBS time sync for your VCR is part of the VBI XDS (eXtended Data Set).   Sometimes your VCR clock can be off by exactly an hour or two, usually this happens when your VCR finds some other TV station's Time Sync signal (Like WGN) in a different time zone...

For a while many of the PC based TV tuner cards could receive the Wavephore/Intellicast HTML files sent over VBI. I have an STB TV tuner, that even came bundled with diagnostic software that lets you look at what lines of the VBI have data. Technically you can pump data there at ISDN speeds. CNN, MTV, QVC, NBC, and others were early adopters. But like so many neat inventions the enabling technology came about a decade too late. And FCC DTV mandates killed any expansion hopes.

Here's a cool device for stripping external Closed Captioned VBI data on and putting in your own.   I'm sure someone could find a way to integrate this into his APRS setup.

http://www.circuitcellar.com/PSOC2002/winners/2.htm

> If you have a TV old enough to have size or hold controls, you
>can roll the pic and see a line of shimmering black and white dots above the

Or if your TV is just out of whack...   I noticed on a friend's TV that was doing this that on many channels just preceeding a series of commercials one of the lines in the VBI made a flashing "box" in the upper right hand corner of the screen. Which got me thinking that if you could figure out that signal you could incorporate it into a VCR or PVR/TiVo to automatically skip commercials... ;)

Can anyone suggest a recommended APRS Icon for a open amateur radio run 802.11b node? Ideally with the SSID maybe as a status message or something.

Also, as I am talking to some folks not currently on APRS, can someone direct me to a visual ICON table that is on the internet?

Thanks!

Jeff wb8wka

Rendered body type: text/plain

Just over a year ago I made an offer to the forum for Lanner EM-520 single board computers. Specifically, the EM-520. These were units taken by the company I worked for in trade, "new in the bag" kind of thing.

Well, there still are some available, so even though I don't work there anymore, I made some calls and I can get the same deal for people on the forum as before. $75 each. With two 8Meg EDO memory sticks included to get up and running.

These are EM-520 boards EXCEPT they were from a CUSTOM build. They have no TV output, and the BIOS is custom to reflect that. Other than that, they are standard EM-520 boards.

These are EM-520 single board computers. The specs are available on the web, including tech sheets, manuals, and drivers. But basically these are MediaGX boards with GXi 180 processors. They have 4 com ports, 2 USB, floppy and IDE, VGA, sound, and a network (10bt) built in. They have a PC-104 connector for both 8-bit and 16-bit, one ISA slot (actually custom, but will take a single generic ISA card), and two memory slots (with 16Meg total of EDO ram provided.) They support the Disk On Chip from M-Systems, but I haven't tested that at all.

The EM-520 boards you find on the web for sale also include TV output. I want to make it very clear these boards were a CUSTOM BUILD and do NOT have TV output. The chips for the TV circuitry are not even installed on the board.

The board takes a standard PC-AT type power supply but with a PS/2 pin style header.

One other point. These boards only have ONE IDE port, not two. If you want a hard disk and a CD, they MUST share the IDE port, or else you will need an adapter for the expansion slot.

The ISA port is actually one of those 'two level' connectors, and I've been told there was a PCI expansion card that could plug in, but I have not been able to find one to verify that it would work in these boards.

Now for the caveats. These boards use standard connectors for the floppy, IDE, and LPT. The other connectors are all 2mm headers. The 4 comm ports are on a single dual row 50 pin header. The VGA, USB, Sound, Keyboard, Mouse and such are on two female 2mm dual row 44 pin sockets. (There is an LCD panel interface as well, on a 44pin dual row pin header.) There are no original manuals, but the manual is available in PDF format.

Finally, these boards ARE discontinued. While still being sold on the web, cables and interfaces are becoming hard to find. When I brought the boards up to test, I just made my own cables, as I never got the 'factory' cables. I made up a CD with descriptions of how I did everything, including some JPGs of the cables I made. I included descriptions including DigiKey part numbers for the headers and cables and such.

I've gotten one of the boards up with Red Hat 5.2 as a very basic straight install, but I have not tried to get other than 'generic VGA' working. Or network or USB.

I did a quick install of WIN95 just to try it, but only added the

VGA driver.

Most of my 'playing' was to get WIN98SE up. Which detected and ran the network and USB 'almost' automatically. And with a decent VGA driver as well. To use the USB, I just had to tell the BIOS to look for a USB keyboard, then the USB was left active for WIN98SE to find and it would work with things like mouse, keyboard, DiskOnKey, and the Intel QX3 digital microscope.

I haven't been able to get in touch with the people I need to yet, but I HAVE been able to make sure the boards ARE available and the original price ($75) will be honored.

In the mean time, if anyone who bought them before has projects they used them for that they can talk about, I'd love to hear from them.

Mike

This set shows the same error that I just fixed in the APRSplus symbol set -- Primary #53 (upper-case T) is incorrectly shown as a thundercloud instead of TV/SSTV .

Secondary 44 (upper-case K) which was also wrong in the APRSplus set IS correctly shown as the Kenwood "W" logo.

Secondary, Upper K, is Correctly showing the Kenwood logo in APRS+SA, and
has for a long time.  The Primary T is incorrect, I'll give you one there.

On my system, at least, upper-K wasn't producing Kenwood logo until I edited
the symbol set.  I've tried several times to send you the revised set after I
brought up this issue last summer, but I never heard back -- don't know if
you got it.   Maybe I got the wrong email address -- I've seen several
different ones for you.   This time I just hit "reply" on the address you
mailed me from.

 I've attached the zip file again to this message to the off-list direct
response.

File   APRSplusIconRev.zip   attached

The Kenwood D700 also supports this setting. They do have an additional
setting that may make sense to use. (They support "first" which only adds
id if it's the first digi to hear it. I've not tested this as I don't have
a Kenwood.)

How does "closed captionning" work?   Data in the horizontal or verticle
sync pulse???   Seems like you could put a ton of info there along with
position data?

just curious,
Doug

On Tue, 12 Nov 2002, larry Also wrote:

there about 20 lines available for time signals, etc. in the NTSC signal being used by the netrworks?
The frame thus isn't compromized (data superimposed seems to cover just what one wanted to see), and the
 data can be used to correlate information for post mission re-creation.   .

CC is an FSTV thing.
SSTV has something sort of similar, but less data, and I have yet to find any spec on it.

The data stream (captioning text) is actually transmitted in the video part of line 20 of the picture as a sequence of black and white dots representing the 1s and 0s of ASCII characters. It's actually part of the video, not an additional signal. Because it is part of the normal video stream, it is transparent to all NTSC transmission systems and automatically gets recorded on VCRs.

On a normal TV, the image is "overscanned"; i.e. the size is set larger than the screen so that the picture completely fills the screen all the way to the corners and goes off the top, bottom and sides -- no black panels such as you typically see on computer monitors. The overscanning ensures that line 20 normally never gets seen. If you have an old TV with size and/or hold controls , you can shrink or roll the pic enough to see a shimmering flickering constantly changing string of black and white pixels on line 20. A pro studio monitor that underscans to reveal the ENTIRE picture will also show it.

>
> SSTV has something sort of similar, but less data, and I have yet to find
> any spec on it.

The SSTV variant called VIS "Vertical Interval Signalling" and IS a digital code placed in the vertical sync interval, not in the video. Of course, in SSTV there is only ONE vertical sync pulse (at the beginning of the transmission) since only one frame at a time is sent, so it is really more like an extended header that preceeds the picture.

Well, in the old days of 8-second 128-line B&W SSTV, sometimes one would send multiple frames in a single transmission so the vertical pulse would do what it does in fast scan (trigger a retrace to the top of the screen for the next frame). Today, with single frames taking 30-90 seconds each, I haven't seen anyone send multiple frames in one transmission.

The VIS is used solely to cause the receiving program to be able to auto-select from one of twenty-odd SSTV transmission modes before the picture is sent.

A quick search with Google for "SSTV VIS" netted the following:

Quoting from:
http://users.rcn.com/sstv/modes.html

"The original 8 second B&W SSTV mode (about 30 years ago) used 5 milliseconds of 1200 Hz for horizontal sync (separating scan lines) and 30 milliseconds of 1200 Hz at the beginning of a frame. The Robot 1200C introduced a new concept called Vertical Interval Signaling (VIS). All recent SSTV systems now use a longer vertical sync with a digital code representing the mode of the following image. This allows the receiving station to select the proper mode automatically.

The VIS code is sent as:

```
        30 mS start of 1200 Hz.
        7 data bits sent LSB first,
                30 mS each, 1100 Hz for 1, 1300 Hz for 0.
        Even parity bit of 30 mS.
        30 mS stop of 1200 Hz.       "
```

A lot more SSTV information is located at:
http://www.tima.com/~djones

including a table of VIS info located at:
http://www.tima.com/~djones/vis.txt

Chromapix talks about "caller id" or "CID", but so far, I haven't seen anything that tells how it's encided.

IMHO, APRN only works if we can get the pictures stored as files, with some link to the position and possibly callsign in the file name.   With that, we can pull up pictures taken by K8XXX on dec 20th near XX.yyy ZZZ.aaa.

Without it, we are stuck with someone having to view the pix, and save them under searchable file names, which is incredibly tedious.

I think this is why APRN never really happened, because there was no way to really link the picture to the sender, and where it was sent from.

I see huge application here for NWS damage surveys, in that teams could just go out an shoot away, and let the system index everything.
The only thing you wouldn't get from this is which way the camera was pointed, and that should be pretty easy to figure if the pix are shot right.

I have some encoder chips that are easy to get ahold of and use, that can put text on top of NTSC video for callsign and position encoding, but that only solves it partially.

>position data?

As stated it's in the VBI, along with time-sync, V-chip data, and text/html services. And yes you can put a ton of data in there, not including Line 21, you can stuff at least 300 to 400 kpbs in the VBI.   If you're willing to give up a portion of the video screen to data you can send info up to 2 MBPS.

http://www.entechnology.com/sections/cybercast.htm

I've also seen some PVR/Tivo updates being sent late at night/early AM over cable TV on the Discovery Channel. It looks like a funny test pattern.

Back to Closed Captioning...

CC is reserved by law to line 21 of the VBI.   Some more info:

http://www.robson.org/capfaq/caption-charset.html

http://www.robson.org/gary/writing/nv-line21.html

As pointed out this info is carried through the NTSC spec. So using composite/component video or s-video - like from a cable box or VCR to your TV - the VBI data will carry over to the TV.   That means if you enable the V-Chip on your TV or monitor, your kids can not bypass it by using an external tuner and input.   I don't know about commercial VHS tapes or DVD's of movies, but I assume they also send NTSC V-chip data.   I don't have any ankle-biters around here so it's never been an issue to me...

The VBI is not sent in SSTV or some ATV.   Although I'm pretty sure the VBI data is sent by the little 2.4 GHz video senders that have become so popular with the ATV crowd - I'm sure throughput suffers.   A number of people have found all kinds of interesting uses for these transmitters, inserting data where video should be.   I do know that it will work with S/PDIF digital audio.

A google search has shown me there are a number of hobbyist circuits and devices that can insert custom CC data into an NTSC video signal.   I can think of all sorts of home automation and APRS applications for this.

```

Indeed, but your range with FSTV is severely limited for any given power level or antenna gain relative
to SSTV.
We're getting 10-20 miles with very simple, and relatively inexpensive systems here, using SSTV, and we
don't need full motion.

If I could put something into the SSTV audio that the receiving app would pick out, and use in the file
name that the image is saved in, then we'd be there.

FWIW, I worked on a system that was supposed to send credit card "negative files" over video back in the
 80's. Unfortunately, they were trying to push it to 6Mbits, and of course almost none of the data got
through.  The idea was that this would be used in inner cities, where of course your broadcast video is
perfect.. <VBG>

If they had stepped the data rate down to maybe 2 mbits or less, they would have had a veritable
firehose of data, but they wouldn't hear it. They were convinced that they could get 6mbits.

270. [aprssig] New APRS toy...

From: "Darryl Smith" <Darryl@radio-active.net.au>
Date: Wed, 13 Nov 2002 19:37:09 +1100
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106776-2002.11.13-03.22.18--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
People...

I have just finished the beta of a new aprs toy... Think Kenwood D7
without the display... For those public service events where you want
some people (race organisers etc) to see what you are tracking, but
don't want to give them a full tracker...

What most people have concentrated on is Trackers, which transmit the
positions from a GPS reciever to the world. I have developed almost
exactly the oposite - a device the recieves APRS packets and uploads
them to a GPS receiever without the need to a transmitting radio.
Basically think of this as being like a D7 radio, without the radio or
display.

The reason I have done it this way is that there are times in public
service events (or my consulting work) where we need to distribute APRS
information out into the field - but where it is not appropriate to have
transmitting stations, or laptops. So I have developed a device that
```

will go between a scanner and a GPS reciever to do that.

At the moment I am decoding AX-25 in an 16F84 IC, and feeding the serial stream into a 16F628. I am working on getting rid of the 16F84 but this might take a little time. I also have a MAX232 in there, but depending on the voltage I choose that might change model, or I might get rid of it all together. [I am pretty sure that 3V will not work for RS-232 high :-)]. I am looking at doing a PCB, but that might take some time... [I also want to do a surface mount version whe I get the bugs out...]

Late last night I was informed that Garmin ETREX GPS recievers (but higher models are) are not compatible with this [Feel free to email GARMIN to complain that the ETREX does not have NMEA/NMEA interface mode - I was really annoyed when I found out]. I am going to have a look at doing a PIC to allow this unit to work with the GARMIN binary protocol. It does not look TOO hard, but you can never tell.

Anyway some photos are available on
http://radio-active.net.au/web/tracking/antitracker.html

Way cool.

You can add the GPS-V to your unsupported list, it only does NMEA out.

Rendered body type: text/plain

I checked my van's position tonight, and it was about 1 block west of where it realy should be. I have noticed in the past that my position (when parked in the vicinity) would toggle between my real position and 1 block to the west. This only happens to my kenwood radio, not to the other NMEA tracker. So I surmise it must be a mic-e conversion problem.

```
KD4RDB-14>APD214,KD4RDB-1,W4APE-9*,WIDE2-1,qAS,wa4ssp:=3356.09N/08024.02Wv06
4/001/Mic-E/M0/Off duty.. ]"4L}
KD4RDB-14>SSUV0Y,KD4RDB-1,KD4PBS-3*,WIDE2,qAr,KF4VTT:'l4l*\v/]"4L}
```

```
KD4RDB-14>APRS,TCPIP,KD4HTW-2*,qAS,KD4HTW-2:@130015z3356.08N]08024.80W/090/1
46/Mic-E/M0/Off duty>
KD4RDB-14>APRS,TCPIP*,KD4HTW-2*,qAS,W1GRE:@130113z3356.08N]08024.80W/090/146
/Mic-E/M0/Off duty>
```

Thanks to the qAS protocol, I know now that the bad posits entered the aprs-IS at w1gre who is 100 miles from me and kd4htw-2 who is 40 miles from me. Both are running winaprs 2.5.1. Could it be that winaprs is mangling the packet by converting it be converting it from mic-e before passing on to APRS-IS? It only appears to happen within a very small area near this location, and only the longitude and speed seem to get mangled. My actual longitude is 80°24'02"w and my speed is certainly not 146mph sitting in my driveway. An earlier packet IGATED by wa4ssp was not mangled and his station ID's with APU24N, what ever that software is. I can't find a listing of APU in the aprs spec. KF4VTT didn't convert the packet at all, and is running UIview32n.

Here are some packets from a minute or two before I stopped transmitting last night...

I've emailed them about a year ago. Got some canned message, but not a real response.

> - I was really annoyed when I found out].

In all fairness, this has been know from day one and has been reported on this list quite a few times. But I can understand your feelings.

What surprises me though is that NMEA-in is being treated as almost a sacred feature. The Garmin protocol has been around for quite a while and has been open for everyone to use. As far as I know NMEA is a closed protocol and you have to pay quite a bit to get the specs.

Garmin Communication Protocol for those interested:

http://www.garmin.com/support/commProtocol.html

> I am going to have a look at
> doing a PIC to allow this unit to work with the GARMIN binary protocol.

Not only this unit but almost ALL Garmins will then be able to use your
toy. Not a bad deal if you'd ask me.

> Anyway some photos are available on
> http://radio-active.net.au/web/tracking/antitracker.html

Very neat toy, Darryl!

It would be awesome if you could make a SMD version. I've been looking
for a SMD version of such a beast (well, actually a TNC) for quite a
while, but have only found them in Europe (no surprise here).

If anyone knows a cheap US source, I'm all ears.

274. [aprssig] WIDEn-n & TRACEn-n question

From: Ben Stienstra <bennys@xs4all.nl>
Date: Wed, 13 Nov 2002 14:41:45 +0100 (CET)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106784-2002.11.13-08.25.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,

I'd like to know your opinion about using WIDEn-n and TRACEn-n. First,
WIDEn-n has the advantage not using all 'via-paths' thus generating less
traffic than TRACEn-n who will use the 'via-paths' to show the route how
the packet travelled.

At the other hand, TRACEn-n gives valuable path information and has the
ability to filter certain packets on callsign. For example, if packet has
come through a certain digipeater, drop the packets and don't digipeat
them, because the digi is too close by. DIGI_Ned has the ability to alter
a WIDEn-n path to TRACEn-n and visa versa.

The question is, should "we" discard usefull path information in place of
shorter transmission times? Does it really yield a lower channel load and
does that matter enough?

Thanks in advance,
Ben, PD2BS

275. [aprssig] proposal for APRS digi cluster, please comment

From: "Chris van Gorp" <pd0rhm@amsat.org>
Date: Wed, 13 Nov 2002 8:8:24
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106785-2002.11.13-08.52.18--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,

Proposal for an "APRS Digi Cluster"

I am proposing a new digipeater configuration that provides:
- A solution for digipeaters that are in the same area and therefore interfering with each other,
- A more reliable digipeater infrastructure.

Given a situation where there are 2 or 3 (or even more) digipeaters in the

same area.
These digipeaters are to form an "APRS digi cluster".

The basic idea is to set up each of the digipeaters up with knowledge of
the existence of the other digipeaters in the 'cluster'.

The digipeater rules are changed in such a manner that frames already
digipeated by one of
the other cluster members are dropped.

Benefits are obvious:
- Digipeaters can be (taken) down without causing problems to the network.
- Not more then the required number of transmission of a frame in the area
of the cluster.

The requirement for this is that:
1) The digipeater should insert its callsign in the unproto path.
(If this is normally not done because of WIDE or WIDEn-n usage, the
callsign must be entered in the path by other means.)
2) The digipeater must have a rule to drop frames already digipeated by one
of the other cluster members.

Experiments with DIGI_NED were partially successful; Roger Barker of UIView
is already made aware of this concept.

This idea originated from both Ben PD2BS and me while we were trying to get
our APRS network working better.

Please feel free to comment.

That's just barely enough.

>Anyway some photos are available on
>http://radio-active.net.au/web/tracking/antitracker.html

Way cool.

You can add the GPS-V to your unsupported list, it only does NMEA out.

It seems to me that OCR these days would be good enough to decode the overlaid
text, especially if it has black behind it or a halftone screen. I'm also
assuming that there are free OCR libraries or a hook could be written to use
the TWAIN OCR stuff that comes with every scanner.

Roger just posted info on that same subject just today.   His example
indicates that using TRACE 'CAN' reduce bandwidth if you simply eliminate
all the software name comments.   I do believe that is what the code at the
beginning indicates.

I would much rather see the path than 'WinAPRS 2.5'.  Path is more valuable.

Yes, i agree on that one, but does WinAPRS always sends a software id &
version as comment? Many users here in the Netherlands use UI-View and
sends all kinds of comments, like email address, name, qth, "have a nice
weekend" and other stuff. Or is Roger talking about discarding the
complete comment?

It would require good and intelligent filters to filter out software names
and id's. And where is the end? What should "we" disregard next? Email
addresses, website's, etc?

kind regards,
Ben, PD2BS

$250, or about the price of a decent GPS receiver. Certainly a bit
much for a hobbyist but not even worth considering for a commercial
enterprise.
```

282. [aprssig] Maps for GPS Chartplotter

From: "Garren Davis" <garren.davis@qlogic.com>
Date: Wed, 13 Nov 2002 08:09:22 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106804-2002.11.13-10.55.14--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello,

I am hoping someone can help me with a question I have
about a new GPS unit I just got. It is the ICOM GP-360ML
GPS chartplotter. The price was $999.99 but BOATUS has it
on sale for 299.99 and until Sunday they give an extra %10
off that price. It uses the Navionics chart cartridges to
display the maps on the GPS but you can only get charts
for the coastal areas. My question is "does anyone know
if I can get chart cartridges that will display roads and
inland areas?" Or is there any software I can use to program
my own blank chart cartridges? This GPS unit is big and
the display is easy to read in my rough riding truck. If
I can get some maps for it then this would be the perfect
addition for my APRS setup. If not then at least I have
a GPS unit I can see and read while driving. Thanks

Garren

For ME, Station ID & SSID, Position with TYPE & Overlay char, Full path
taken, Weather Info, and short message as required. Software product is
already CODED but really, who cares what program sent the packet? What
difference does it make. It adds nothing to the information you are trying
to pass.

How about including the type, model, power, antenna, antenna height in EVERY
VOICE transmission in all bands. Overkill.

This has been a long term debate.  I dont like using the 3rd party format
as a defacto LOOP filter in the APRSIS.  The 3rd party format is used in
many other applications other than just gating internet traffic to RF,
thus, it should not be used as a REJECT filter to prevent IS looping.
(thought that is how Mac/WinAPRS and APRServe initially began doing things
for simplicity of loop filtering.).

Now that we have other mechanisms to identify packets that have traversed
the APRS-IS, I favor moving away from this 3rd party loop-filter cruch.
Filtering based on TCPIP has always been a good method.  Now filtering on
the Qas construct (or whatever it currently is) is another...

Several comments for you Garren-

Most times in BOAT/US sales electronics are only discounted 5%, you have to
read the fine print.

I'm not aware of any Navionics cartridges with roads, but you could check
there web site.

You might also check out the LowRance & Garmin units that have a CD of maps
available. I have two LowRance units that I use in my truck & they work fine
with APRS.

> whatever it currently is) is another...

A little clarification drawn from previous discussions.

The q construct should never appear on RF.
No third-party packets should ever appear as third-party packets on
APRS-IS.

Third-party packets with TCPIP or TCPXX in the third-party header
(latter is up to the IGate operator) should never be gated back to
APRS-IS.  Third-party packets without TCPIP or TCPXX should be gated
back to APRS-IS as standard packets (not third-party).  This last is
accomplished as follows:
```

```
XGATE-1>APRS,WIDE2-2:}MYSPCL-1>APRS,MYNET*,XGATE-1:rest of packet
```

Should be gated to APRS-IS as:

```
MYSPCL-1>APRS,MYNET*,XGATE-1:rest of packet
```

The gating station may add a q construct or ,I construct to the header as desired.

Problematic in the above is the possibility of looped gating as follows:

```
RF: XGATE-1>APRS,WIDE2-2:}MYSPCL-1>APRS,MYNET*,XGATE-1:rest of packet
APRS-IS: MYSPCL-1>APRS,MYNET*,XGATE-1:rest of packet
RF: XGATE-2>APRS,WIDE2-2:}MYSPCL-1>APRS,TCPIP*,XGATE-2:rest of packet
MYNET: MYSPCL-1>APRS,TCPIP*,XGATE-2:rest of packet
RF: XGATE-1>APRS,WIDE2-2:}MYSPCL-1>APRS,MYNET*,XGATE-1:rest of packet
```

Based on this potential loop, full third-party packet filtering at the IGate may be necessary. (MYNET is a mythical network for example purposes only.)

>From previous discussions, some have expressed a desire to be able to gate to RF not using the third-party format. While this is problematic for many reasons, it implies that TCPIP or TCPXX either in the third-party header or in the regular header means "do not gate to APRS-IS".

Charlie,

I received a flyer from BOAT/US in the mail last week. On the front page they had the GP360-ML GPS chartplatter for $299.99. At the top of the flyer it said %10 off of everything from 11-15 thru 11-17. I went to their store to look at the unit and the salesman said he would give me the %10 off even though the sale had not started yet. I don't know why it was discounted from $999.99 to $299.99 but with the %10 discount it seemed like a good deal so I bought it. It does not have WAAS but it can be upgraded to include it.

Charlie,

I forgot to mention that I looked on their web site for cartridges
with roads. I did a google search also and could not find anything.
I was hoping there was some sort of software package that could
generate maps and program a blank cartridge.

The full proper command in a KPC-3 or KPC-9612 digipeater is

UIFLOOD WIDE,28,NOID   (as opposed to "ID").

Home stations should always have UIFLOOD OFF.

> id if it's the first digi to hear it. I've not tested this as I don't have
> a Kenwood.)

Yes, I asked both Kenwood and Kantronics to add a FIRST option, because
of all the problems we have had with people wrongly setting the ID
setting.  With FIRST set, then the first digi that hears the packet will
add its callsign (if there is not one already there) so that we can always
see where the packet entered the network.

But it will be years before we see this evolved into the existing APRS
infrastgructure.

Remember too, that we do NOT WANT TO SEE mobile Kenwoods with UIFLOOD
enabled!  This would be disaasterous to the network, unless the D700 is
actually on a  mountain top serving intentionally as a WWIDEn-N digi.

This is very dangerous thinking. APRS is fundammentaly dependent on a
certain level of duplicate packets to make up for lost packets due to
collisions. APRS was designed with the concept that there would be
MULTIPLE dupes of most packets on the air to add reliability to DELIVERY.

I oppose methods taken to arbitrariliy eliminate all dupes. This
undermines the reliability of the network for packet delivery.

How many dupes are too many? Id say 3 or more. How many are too few?
0. SO the design of a proper network that has the intention of optimizing
network RELIABILITY (including packet delivery) must have some dupes in
the system. RIght about an original packet and a follow-up dupe is
probably the best design...

This is a very complex and mathematically determinant system to optimize
for both throughput and delivery relibility. If you want to filter
somethign out, filter out DX packets coming in from out of area. but
this is a very hard thinng to do without undermining the consistency of
the network...

I would like to take an opportunity to express my thanks to Dale Huguley, KQ5QD, for all of his time and effort with the WXSVR APRS server project. Last weekend he had to take the WXSVR down to perform upgrades to his shack. Unfortunatley, Mother Nature didn't check with him before he started. As luck would have it, one of the worst outbreak of severe weather hit the Southeast in quite sometime Sunday/Monday. I e-mailed Dale when allot of this was starting to develop...and he quckly became pro-active and set up the WXSVR server in another part of his house. We were blessed to have that vital information quickly returned to this area...
--- From all of us Dale....Thanks ---

>(If this is normally not done because of WIDE or WIDEn-n usage, the
>callsign must be entered in the path by other means.)

This is what is killing the idea. Digipeating on destination SSID will also not always include the callsign of the sender. You can make rules in DIGI_NED to always add the callsign of the sender, that's what the "hijack:" rule in DIGI_NED was for, which substitutes the call just before WIDEn_N. This can however trash the digi call where the packet entered the system (like "ID" in the KPC TNC). If you don't use the "hijack:" rule but just add the call then WIDEn-N behaves like TRACEn-N; that's not wat you want either. You could add the call at the end, but then also the packet gets longer and longer each time it passes such a cluster digi. I don't see any workable scenario here.

>2) The digipeater must have a rule to drop frames already digipeated by one
>of the other cluster members.

This will require that one of the repeaters always acts slower than the other to be able to stop the packet in time. They both receive the packet at exactly the same time so the repeat of the other digi will always be received later. So instead of immediate transmission of a received packet, the digi needs to queue the packet for a few seconds and take the packet from the queue as soon as it sees that the other digi caught it already. This can be done however, detection if a packet is already transmitted by its twin will be the hardest.

>Experiments with DIGI_NED were partially successful; Roger Barker of UIView
>is already made aware of this concept.

This idea exists for years already and I thought about it a lot, but I'm not able to find a working solution in the current APRS system without throwing a lot of functionality away.

A suggesion might be to detect if the same packet is recieved twice immediately after eachother to detect that the other digi got it. But this doesn't work because the interesting scenario is if one or the other fails to receive the original packet.

Receiving one packet may mean that you missed the original, if you then

retransmit the packet, which is already repeated by your twin, the the
cluster digi eats up 2 hops instead of one. If your twin missed the packet,
then you also see one packet, the original. If you then transmit it, the
twin will see it for the first time and also transmit, again eating two
hops. So if one or the other missed the packet, both will eventually
tranmit it and the cluster will use up 2 hops. This is not what you want...
It works for 50% if only one digi has "twin" packet detection and the other
is just a plain digi.

The only way this works is if you see two packets, but if you always see
two packets then you didn't need this cluster scenario in the first place,
one would be reliable enough...

Besides this you get terible deployment problems, most users will not know
how to setup such a digi cluster. It's already hard enough to get the
Kantronics TNC configured correctly.

There are easier alternatives:

If you want more reliability then my proposal would be to use two radios at
some distance and connect it to one PC with a repeater. This is some sort
of RX diversity setup (no TX diversity; I think only of the radio's should
actually transmit since you cannot transmit simultaneously without
destroying the signal and having one radio transmit after the other would
take away too much channel capacity).

If you want to make it work with 2 digipeaters then these two need an extra
communication channel between eachother to exchange data about what has
been repeated already, for example sharing the data that is retained to do
duplicate checking between with both digipeaters.

If you want to back up, then just make a backup digi that looks for the
call of the main digi. If not seen after 20 minutes then also start
digipeating. Stop as soon as the call of the main digi is seen again. Now
the backup digi works as hot-standby and reception of the call of the main
digi is kind of resetting the watchdog. To be sure you can let the main
digi send its call in a short ID packet (with no digi path) so it is
guaranteed to be transmitted at least every 5 minutes or so; after 15
minutes you can more or less be sure that the digi is dead if the call is
not seen.

I hope this comment is usefull for you and others.

Kind regards,

Henk.

I also did it, it seems the eTrex ran out of memory. I added the message I
got below. As usualy the answer is incomplete with respect to my questions,
but at least somebody bothered to answer.

As I see it, no chance unless they dump some other functionalty to make space.

Kind regards,

Henk.

(note that I expanded by question to make it readable again, in the
original response they made one big unreadable line out of it)

Hi Henk,

Sorry, the standard eTrex does not have sufficient code space to have these features added - although our engineers are working on it and may find some way of doing this in the future.

Comments about the track lines have been noted by our engineers, but I do not know if they intend to change this setting.

The NMEA input was part of the update for the eTrex European.

GARMIN Product: eTrex
Serial Number:
Software Version: 2.10
Problem:
Hello Garmin,

3 quick questions, not found in the FAQ:

1) On the update page I see the european model, sw 2.05 has the following feature:

"Added Hunt / Fish outlook page and Sun / Moon outlook page"

Will this be added to the US version too? (my unit has the US version). If not, is there any way to convert my US version (eTrex - Bravo 6) to a european version?

2) Will there be a version with 1 pixel-thick track lines?

3) If the eTrex could accept $GPWPL input when NMEA is used whould be realy great!

I hope you can answer my questions,

Kind regards,

Henk.

P.S. I think the eTrex is fantastic, I use it with APRS on HAM-radio. It
works great (but you already knew this I guess...).

Message-ID: <LYR842-106871-2002.11.13-18.18.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Hi Bob,
Thanks for your explanation, it gives me a better idea how APRS is ment to
work. What i understand is that a packet needs to be duplicated several
times to get a reliable system. But in what area, should a packet be
duplicated within 10km or 50km? It seems useless to me to digipeat a packet
that is already digipeated by a system within a 10km radius. One might think
```

of a intelligent system that finds out how close the nearest digipeaters are
(position beacon) and if that system is within 10km distance drop the
packets and if it further away digipeat the packets.

Maybe the real question is, what area do you want to cover with the system?
Do you want to cover 150km's radius with a wide3-3, or do you want to have a
very reliable system that covers only 50km with wide3-3?

kind regards,
Ben PD2BS

306. [aprssig] UI-View & the National Weather Service (US)

From: "Phil Pacier, AD6NH" <ad6nh@arrl.net>
Date: Wed, 13 Nov 2002 18:18:59
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106876-2002.11.13-19.02.52--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just got back from the National Weather Service office in San Diego, CA, where I am the coordinator of Skywarn operations. I had just finished installing UI-View at the Skywarn desk when the IT guy asked me to demo the software for him. To make a long story short, by the time I left the office, UI-View had been installed at 4 other terminals in the office so the forecasters could get immediate weather information. Using UI-View's internal server, and setting the 4 aux terminals up as read-only stations, a mirror image of weather data from the main UI-View station (WX6SGX) is now available for use. The setup was very easy - it took more time to make some custom maps than it did to install the software! If any NWS or Skywarn personnel out there would like more information on how to make UI-View useful to the forecasters and not just the radio operators, don't hesitate to email me at ad6nh@arrl.net. I'd be more than happy to help! And thanks Roger for continuing to support a great program. 73s

307. [aprssig] homeseer script for aprs

From: "Wes Johnston" <wes@johnston.net>
Date: Wed, 13 Nov 2002 19:36:42 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106879-2002.11.13-19.21.05--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Any of you running Homeseer software may be interested. Since it has voice recognition, you can ask it a question which in turn runs a script. This script pulls the text portion of a findu web page and speaks parts of it. Makes me wonder about hooking this up to a 2m rig tuned to the output of your local repeater. Imagine... come on the air, say "computer, where is k d 4 r d b dash 1 4." A few seconds later, the answer comes over the repeater... kd4rdb is 38 miles west of columbia south carolina, last heard 2 hours ago.

I want to add a few things like local waypoints that supercede findu's city distances, but how's this....

Wes

```
' get and speak a station's position from www.findu.com
'
' enter your callsign and ssid here

dim callsign
callsign = "kd4rdb-14"

sub main()

 dim position
 dim i
 position = hs.GetURL("www.findu.com","/cgi-bin/find.cgi?"+callsign,1,80)
 position = lcase(position)
 position = right(position,len(position)-instr(1,position,"position")+1)
 position = left(position,instr(1,position,"raw packet")-1)
 fixtxt position
        hs.speak position

end sub

sub fixtxt(txt)
 ' convert all carriage-return-linefeed pairs to ", " so it speaks properly
 do
  i = instr(1,txt,vbcrlf)
  if i = 0 then exit do
  txt = replace(txt,vbcrlf,", ")
 loop

' some text to speech engines don't allow custom pronunciation, so we have
to cover state
' abbrev's
 do
  i=instr(1,txt,"sc")
  if i=0 then exit do
  txt = replace(txt,"sc","south carolina.")
 loop
 do
  i=instr(1,txt,"nc")
  if i=0 then exit do
  txt = replace(txt,"nc","north carolina.")
 loop
 do
  i=instr(1,txt,"va")
  if i=0 then exit do
  txt = replace(txt,"va","virginia.")
 loop
 do
  i=instr(1,txt,"kd4rdb-14")
  if i=0 then exit do
  txt = replace(txt,"kd4rdb-14","Wesses van")
 loop
 do
  i=instr(1,txt,"kd4tqz-14")
  if i=0 then exit do
  txt = replace(txt,"kd4tqz-14","Lee's truck")
 loop

end sub
```

LOL that's why I know it supports it even though I don't have one. We used one as a Wide for a special event last spring and I researched it to make sure I could assist that station if he needed help. He was actually in the bottom of a canyon and we had to relay voice messages to him if needed. We had another temporary digi on a peak he could hit.

Bill

Just because you hear a packet or a single digi hears a packet, there is
no asurance at all that any other digi heard that packet. Usually a digi
digipeats a packet and has 3 surrounding digis for further propogation of
that packet. But just becuase the digi digipeated it, there is NO
ASSURANCE that the other 3 got it. Maybe one did, but the other two did
not due to collisions in their area. Thus, if you filter out all but one
copy of a packet, you can guarantee that the packet is not going to make
it out the desired number of hops the sender intended in all directions.

It can be proven mathematically over and over, that in a lossy network
like APRS (where any colision kills a packet) that you MUST have dupes if
you want delivery reliability.

Yes, we shoud strive to eliminate multiple dupes, but any attempt at
eliminateing all or even most dupes is also degrading the reliability of
the network. There are many things that need to be worked on in APRS,
eliminating dupes is not an important one in my opinion. Other than
proper traiing of users in to proper path selection...

> of a intelligent system that finds out how close the nearest digipeaters are
> (position beacon) and if that system is within 10km distance drop the
> packets and if it further away digipeat the packets.

No way. That killls delivery reliability. somewhere, someone is always
going to have a collision. You cannot throw out dupes without
eliminating someon's chance of hearing the packet.

> Maybe the real question is, what area do you want to cover with the system?
> Do you want to cover 150km's radius with a wide3-3, or do you want to have a
> very reliable system that covers only 50km with wide3-3?

Tune your system to match your "local" network needs. In some areas with
few users, the local net can be thousands of square miles. In other
areas, it can only be 10's of miles. But this is easy. The area can be
NO LARGER than what can be handled at 1200 baud. This is easy to
calculate.... See below...

Any more than that, and the system falls apart as far as reliability is
concerned. Sure you can see HUNDREDS of people, but you cannot comunicate
RELIABLY under stress. That is what APRS was designed to do...

Lets do it... OK, here are some numbers:

```
 5 mobiles at 1 min rate          5 per min
```

6 mobiles at 2 min rate	3 per min
5 WX stations at 5 min rate	1 per min
3 local digis at 10 min rate	.3 per min
10 area digis at 20 min rate	.5 per min
30 regional digis at 30 min rate	1 per min
30 Homes Status at 30 min rate	1 per min
Homes Posits at 30 min rate	1 per min
3 msgs at 1 min rate	3 per min
total is	16 per min
digipeated once	32 per min
Channel capacity	50%

And APRS is not reliable above the ALOHA rate of 20% or so of channel capacity so you see that a 1200 baud channel in this case may just barely work with a lot of lost packets for only about 50 users using only ONE HOP.

Now let there be 3 hops and you can only have about 15 people in that area able to use APRS reliably... So it is easy to see how APRS in areas with everyone doing 3 hops is UNRELIABLE! and there is NOTHING you can do to improve this other than telling everyone to reduce the number of hops and plan on having a smaller community network.

We see all the time, crazy ideas about filtering, where people want to see hundreds of statiosn all over 1000's of miles... but DUH, it cannot be done RELIABLY. Sure, the map will appear to have LOTS of people on it, but MOST PAKCETS dont get through, you cannot communicate, in real time, and tactical use of APRS in that situatino is impossible...

Sure it LOOKS nice. But APRS is not about pretty maps full of ICONS all over the state and region! It is about COMMUNICATING RELIABLY LOCALLY!

Draw a circle around your 50 nearest users and get them to all use only 1 HOP and that is your APRS local network...

Good luck!

311. [aprssig] APRS network MISSUNDERSTANDINGS

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 13 Nov 2002 22:18:43 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106889-2002.11.13-22.02.38--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

In case some of you missed it, here is a short note on APRS expectations: In a nutshell, if you are seeing more than a few dozen active (30 to 60 or so) stations on your map then you are NOT seeing everything in your area. Because you are seeing TOO MUCH that is colliding with local probably mnore valuable info..

Remember, APRS is for RELIABLE tactical real-time communications. at 1200 baud, this equates to an EASY TO CALCULATE number for whatever you plan on doing with APRS in your area... But it is a LOT SMALLER than what most people think...

OK, here are some numbers for routine operations:

5 mobiles at 1 min rate	5 per min
6 mobiles at 2 min rate	3 per min
5 WX stations at 5 min rate	1 per min
3 local digis at 10 min rate	.3 per min
10 area digis at 20 min rate	.5 per min
30 regional digis at 30 min rate	1 per min
30 Homes Status at 30 min rate	1 per min

Homes Posits at 30 min rate	1 per min
3 msgs at 1 min rate	3 per min
total is	16 per min
digipeated once (ONE HOP GUYS!)	32 per min
Channel capacity	50%

And APRS is not reliable above the ALOHA rate of 20% or so of channel capacity so you see that a 1200 baud channel in this case may just barely work with a lot of lost packets for only about 50 users using only ONE HOP.

Now let there be 3 hops and you can only have about 15 people in that area able to use APRS reliably... So it is easy to see how APRS in areas with everyone doing 3 hops is UNRELIABLE! and there is NOTHING you can do to improve this other than telling everyone to reduce the number of hops and plan on having a smaller community network.

Sure, the map will appear to have LOTS of people on it, but MOST PAKCETS dont get through, you cannot communicate, in real time, and tactical use of APRS in that situation is impossible...

Sure it LOOKS nice. But APRS is not about pretty maps full of ICONS all over the state and region! It is about COMMUNICATING RELIABLY LOCALLY!

Draw a circle around your 30 nearest users and get them to all use only 1 HOP and that is your RELIABLE APRS local network...

Good luck!

312. [aprssig] APRS network MISSUNDERSTANDINGS (part 2)

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 13 Nov 2002 22:30:36 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-106891-2002.11.13-22.14.29--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

How many mobiles and stations can APRS handle at a special LOCAL event? Here is an example special event with lots of mobiles and messages:

6 mobiles at 1 min rate	6 per min
6 mobiles at 2 min rate	3 per min
1 WX stations at 5 min rate	.2 per min
3 local digis at 10 min rate	.3 per min
10 EVENT Stations at 10 min rate	1 per min
EVENT Posits at 10 min rate	1 per min
5 msgs at 1 min rate	5 per min
5 ACKS at 1 min rate	5 per min
total is	22 per min
digipeated once	44 per min
Channel capacity	75%

So MOST of these packets will not be reliably seen by everyone in the event because the number of packets is WAY over the ALOHA optimum of about 20% channel capacity. Thus most will be involved in collisions. Yes someone will see most of them some of the time, but it is NOT A RELIABLE NETEWORK!

And NOTE that this is on a LOCAL (not 144.39) frequency with only ONE
digipeater and NO OUT OF AREA PACKETS...

I think too many people ignore these simple basics. If you want to see
more than a few dozen stations, then you should watch the INTERNET feed,
dont expect it on RF, or you will have an UNRELIABLE network that cannot
be used when you need it... for real time reliable comunications.

Sure it LOOKS nice. But APRS is not about pretty maps full of ICONS all
over the state and region! It is about COMMUNICATING RELIABLY LOCALLY!

Draw a circle around your 50 nearest users and get them to all use
only 1 HOP and that is your APRS local network... now, DO SOMETHING WITH
IT... not just pretty maps collecting ICONS...

Good luck!

There is a statewide emergency drill for California Hospitals and other
health providers, commencing around 08:00 local time today.

I haven't seen it mentioned here, but this is just an advise that there may
be some APRS traffic relating to this drill.

> the network. There are many things that need to be worked on in APRS,
> eliminating dupes is not an important one in my opinion. Other than
> proper traiing of users in to proper path selection...

If the digi receives a duplicate then at least one of it surrounding digis actually saw the packet. If your digi saw it come back then its likely that other digis saw it too. I think the most interesting case is when you do NOT see a duplicate, that's when a retransmission is needed more urgent!

So if redundant transmissions are important then you should not do it only when it is needed the least but make sure it is done when its needed the most. In fact this implies that you should always do it!

That can be done in a much more controlled way, not relying on a flaky duplicate reception, a digi could SEND each packet it receives twice with a short interval. That will also help if all the surrounding digis missed the packet. This also doesn't eat two hops as is the case when the packet is looped back (one hop for the digi that digipeated the packet back to you and the hop your digi eats for the retransmission)

This way the network can ensure that there are redundant transmissions and does not rely on an unrelieable duplicate reception.

If you want to experiment with this it can be done today with DIGI_NED. If you have rules like:

```
digipeat: 1 WIDE 1
```

then just name the destination port (the second name) twice:

```
digipeat: 1 WIDE 1,1
```

Then all packets received on port 1 where the next digi is WIDE will be transmitted via port 1 twice! If you adjust all the rules in the rulefile accordingly then you can experiment with this setup.

One word of caution, redudant transmissions increase reliability but also increase the channel load. So the area gets smaller and the users shall use less hops. In return communication in the area will be more reliable. This is the tradeoff of this scheme, but is in fact valid for allowing redundant transmission in general, the more redundancy you add, the more reliable it gets but also the smaller the area you are able to cover.

Fundamental question: what area do you want to cover how reliable to you want it too be. Also the settings the users use play a big role and the quality of the equipment (how much packets are lost which could have been detected).

Other ways of redundancy are to use multiple displaced recievers in a digi so when one reciever misses it the other may receive it. That will not increase the channel load, but will increase the cost of the digi...

APRS is one big tradeoff of pro and cons, you can't have it all at the same time.

Kind regards,

Henk.

> usefulness.

No, you confuse TAPR monitor output with the AX.25 packet format. Every call in the header is exactly 7 bytes, regardless SSID. Even a short digi name like "B" takes exactly the same space in the AX.25 packet as "PA0ABC-15". Only your monitor string is shorter, but I don't think that's an issue.

Kind regards,

Henk.

Be very cautious in implementing this, as the vast majority of IGates in deployment have no knowledge of the q construct.

All,

Thanks for the comments,

It is nice to observe that opinions differ:

Were the proposal is to prevent duplicates and so prevent collissions, it was commented that duplications add to the reliability.
('what is 'reliable' for one ...')

TMHO the word reliable is not proper for a connectionless network protocol.

On the other hand this discussion resulted in some good suggestions.

If any of this results in a pratical solution, or other proposal, it will be communicated at this SIG.

Again thanks.

That's why it was said "_add_ to the reliability", without indicating
any degree of reliability or even implying that delivery of packets
could (and should) be guaranteed.

Let's stop stating the obvious.

On Wed, 13 Nov 2002, Ken Cechura wrote:

> But what is the ALOHA limit?

It is 18%. for pure ALOHA, and I think 36% for carrier sense multiple
access, but that is only if every station can hear each other (which does
not exist on APRS)... But these statistics are for some measure of
success in an ACKED system with retries. When the channel loading gets
above the magic number, the throughput rapidly goes to near zero as
everyone is sending retries and nothing new is getting through.

Notice the key word "retries". So since APRS does not ACK or "retry" that
is why there MUST be dupes built into the system to sort of "pre-retry"
to have any measure of success in the case of colisions...

If the atmosphere was a constant, there was no such thing as multipath, and there was no interference from other RF sources, and each non-digi APRS station operated with exactly the same power, then the system would be very much like the description that you so often share with us. But we all know that this is not true, and thus the dupes have to be in place so that when a high power station comes through with 50 watts, or a paging transmitter malfunctions and starts screaming out IM that we can still rely on the system to work about 80% of the time.

On another note...

PSIA (Professional Ski Instructors of America) is selling a new watch.
One of series of watches that does barometric pressure to calculate
vertical drop.

I saw in the blurb it also calculates speed. I wonder if it's doing
anything
with GPS? I'll have to look into it. If nothing else, it communicates
with
a PC and it might be a neat way (although probably pricey) to get pressure
for weather info.

Mike

I live in a hilly section of western New Jersey where the hills top out at
about 1,000 feet msl and the valleys from 200 to about 400 feet msl.
Although there are a number of well-placed digis fairly close to each other
in NW and West central NJ, most of the time when mobile I can hear at most
one, and not even consistently one at data quality for the D700, because of
the terrain. The digis, however, all hear each other. Under the proposal,
I would hear at most 20 percent of what I hear now since only one digi
would send each packet which means that the D700 would receive virtually
no packets, even in my very active on APRS area. I don't believe that the
proposal would succeed in an area such as mine.

73,

---Ken W2KB@ARRL.net
>But we all know that this is not true, and thus the dupes have to be in
place so that when a high power station comes through with 50 watts, or a
paging transmitter malfunctions and starts screaming out IM that we can
still rely on the system to work about 80% of the time.<

325. [aprssig] Deluo GPS

From: Mike Musick <mikemusick@earthlink.net>
Date: Fri, 15 Nov 2002 13:44:43 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-107191-2002.11.15-14.29.28--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

With a tip of the hat to Allan Sadowski, AH6LS, I purchased a Deluo
GPS. It arrived yesterday and has already been tested, and taken
apart and reassembled two or three times.

I like this GPS, and as part of a larger GPS project have put
together a web page with a small review and technical details about
it. If you're interested in details of a cheap but still good GPS,
take a look at:

   http://www.pocketaprs.com/gps.html

This page is incomplete, but the Deluo information is largely there
and should be a passable reference for it in the interim.

For more information read Andrew Tanenbaum's book "Computer Networks"
published by Prentice Hall Publishers. It has a whole section about packet
radio, starting from pure Aloha and adding features to increase the channel
capacity.

>Notice the key word "retries". So since APRS does not ACK or "retry" that
>is why there MUST be dupes built into the system to sort of "pre-retry"
>to have any measure of success in the case of colisions...

I think you don't want dupes, what you want are redundant transmissions.
Instead of relying on the dupe artifact I think its much better to have
retransmissions designed in. You designed them in for messages using a
decay algorithm. For other types of packet you could make the digi send the
packet twice with a short interval.

As noted before, if you don't recieve a dupe then that means that a
retransmission is needed more then when you receive one. So I think looping
duplicate packets is not the answer to more reliability.

In your example with 3 surounding digis and only 1 that receives it, then
most likely some of the others will still get the packet via a another:

```
(simple grid, use fixed space font!)
                   D3
                  /  \
                 /    \
                /      \
               /        \
D2--------- D1         D6
   \           \        /
    \           \      /
     \           \    /
      \           \  /
      D5 --------- D4
```

Scenario 1, Digis with tight dupe checking
- D1 sends a packet
- D2 and D3 miss it, D4 hears is
- D4 sends the packet
- D1 hears a Dupe, D5 and D6 hear the packet for the first time
- D1 doesn't transmit due to dupe checking
- D5 and D6 send the packet
- D2 and D3 heard the packet - via 2 hops
- D2 and D3 heard the packet - via 2 hops, D4 heard a dupe

Scenario 2, Digis allowing one dupe

- D1 sends a packet
- D2 and D3 miss it, D4 hears is
- D4 sends the packet
- D1 hears a Dupe, D5 and D6 hears the packet for the first time
- D1, D5 and D6 send the packet
- D2 and D3 heard the packet - via 2 hops, D4 heard a dupe
- D2, D3 and D4 send the packet

Note also that it is likely that either D2 or D3 was actually the digi that send the packet to D1 in the first place!

So this has the same result. But what happens if all surrounding digis mis the packet.

Scenario 3, all digis arround D1 missed the packet:
- D1 sends a packet
- D2, D3 and D4 miss it

Now its done! D1 doesn't hear a dupe so doesn't retransmit. So when D1 does not hear a dupe, THEN it should retransmit. I think the HamHud guys understood this!

Both scenario's again, but now with a digi that sends each packet twice:

Scenario 4, like scenario 1 with double transmission
- D1 sends a packet
- D2 and D3 miss it, D4 hears is
- D1 sends second packet (D4 waits for D1 due to DCD)
- D2, D3 and D4 hear the packet without loss off hops
- D2, D3 and D4 send the packet also twice
- D1 hears the Dupes, D5 and D6 hear the packet for the first time
- D1 doesn't transmit due to dupe checking
- D5 and D6 send the packet
- D2 and D3 heard the dupe packet and throw it away

Scenario 4, like scenario 1 with double transmission
- D1 sends a packet
- D2 and D3 miss it, D4 hears is
- D1 sends second packet (D4 waits for D1 due to DCD)
- D2, D3 and D4 hear the packet without loss off hops
- D2, D3 and D4 send the packet also twice
- D1 hears the Dupes, D5 and D6 hear the packet for the first time
- D1 doesn't transmit due to dupe checking
- D5 and D6 send the packet
- D2 and D3 heard the dupe packet and throw it away

Scenario 5, like scenario 3 (compelte loss) with double transmission
- D1 sends a packet
- D2, D3 and D4 miss it
- D1 sends a packet again
- D2, D3 and D4 got it
- D2, D3 and D4 send the packet

This is the difference. Redundancy by design and not by accident. It saved the packet in scenario 5 and saved 2 hops in scenario 4.

All these redundancy scenario's produce more data, so in all cases the coverage area will be smaller. Note also that when every digi receives everything a double transmission creates just as many packets as allowing one dupe - except that dupes die faster as they have used up 2 hops in their retransmission. Not also that allowing dupes more easily screws up the order of packets.

If there are enough nodes in the network strict dupe checking still creates a reliable network - in that case there are enough redunant alternative paths like in the example above D5 and D6 which fed back the packets from D4 to D2 and D3 without the need to use D1.

Kind regards,

Henk.

Yes, exactly the point, thanks for the comment....  APRS is designed for
mobiles.  Mobiles have on the order of 10 to 30 dB of additional path loss
(remember, it only takes a 1 millisecond mobile flutter to kill a packet)
than a home station.  So the fact that home stations see lots and lots of
dupes from every digi within 50 miles says hardly anything about getting a
packet to a mobile..

Even with perfect dupe elimination, WIDE3-3 will typically generate 21
dupes to someone high enough to hear them.  So dupes that HOME stations
hear should not be used as an excuse to go crippling the network...

Thanks for the comment..
 de WB4APR,
Bob

I am looking at getting a Kenwood D700. I recall that there are some
GPS mapping units that will display as waypoints stations that the D700
hears. i did a Google search but could not come up with anything
definitive. i recall seeing something about the GPSMAP 176 being able
to do this. Does anybody have any experience/suggestions in this regard.

Don't know about others .. but my Garmin GPS III (and I suppose the current
III+) does it just fine. I'm not sure what you mean by "...GPS mapping
units.." however.  The III and III+ are GPS's that also have a map database.
There are other units with larger, more visible screens.

Most Garmin units support two-way NMEA.  The $GPWPL string allows for
sending waypoint data to the unit and from it.  I wrote a small program
that runs in windows and will format a string from user input and send the
string to the unit.  I have tested it on my GPS III+, GPS 12 and 38.  I
have no confirmations on eTrex units or units older than the 38, such as
the 45.  What I am getting at is...it is possible to do this.  The last
time I looked into it, the D7 supported this.  I'm sure the D700 would then
also.  This function is really best used with a mapping unit such as the
GPS III+.

If you want to see the program I wrote, go to www.ke4nyv.com and go to my
software section.
